

Cysteine Protease InhibitorsField of the invention.

This invention relates to inhibitors of cysteine proteases, especially those of the papain superfamily. The invention provides novel compounds useful in the prophylaxis or treatment of disorders stemming from misbalance of physiological proteases such as cathepsin K:

Description of the related art.

- 10 The papain superfamily of cysteine proteases is widely distributed in diverse species including mammals, invertebrates, protozoa, plants and bacteria. A number of mammalian cathepsin enzymes, including cathepsins B, F, H, K, L, O and S, have been ascribed to this superfamily, and inappropriate regulation of their activity has been implicated in a number of metabolic disorders including arthritis, muscular dystrophy, inflammation, glomerulonephritis and tumour invasion. Pathogenic cathepsin like enzymes include the bacterial gingipains, the malarial falcipains I, II, III et seq and cysteine proteases from *Pneumocystis carinii*, *Trypanosoma cruzi* and *brucei*, *Crithidia fusiculata*, *Schistosoma* spp.
- 20 The inappropriate regulation of cathepsin K has been implicated in a number of disorders including osteoporosis, gingival diseases such as gingivitis and periodontitis, Paget's disease, hypercalcaemia of malignancy and metabolic bone disease. In view of its elevated levels in chondroclasts of osteoarthritic synovium, cathepsin K is implicated in diseases characterised by excessive cartilage or matrix degradation, such as osteoarthritis and rheumatoid arthritis. Metastatic neoplastic cells typically express high levels of proteolytic enzymes that degrade the surrounding matrix and inhibition of cathepsin K may thus assist in treating neoplasias.

International patent application no WO02057270 discloses compounds of the formula I

where UVWXY broadly corresponds to the P3 and P2 of dipeptide cysteine protease inhibitors, Z is inter alia O, S, methylene or -NR-, R¹ is alkyl, alkylaryl etc and P1 and Q1 are each methylene, optionally substituted with various carbon chains and cyclic groups. The compounds are alleged to be useful for the treatment of protozoal infections such as trypanosomes.

We have now discovered that introduction of a halogen atom at a particular ring position produces an order of magnitude increase in potency against cathepsin K.

10 Brief description of the invention

In accordance with the invention, there is provided compounds of the formula II:

15 wherein

one of R¹ and R² is halo and the other is H or halo;

R³ is C₁-C₅ straight or branched chain, optionally fluorinated, alkyl;

R⁴ is H; or

R³ together with R⁴ and the adjacent backbone carbon atom defines

20 a spiro-C₅-C₇ cycloalkyl, optionally substituted with 1 to 3 substituents selected from halo, hydroxyl, C₁-C₄ alkyl or C₁-C₄ haloalkyl; or optionally bridged with a methylene group; or

a C₄-C₆ saturated heterocycle having a hetero atom selected from

O, NRa, S, S(=O)₂; where Ra is H, C₁-C₄ alkyl or CH₃C(=O)-;

25 R⁵ is independently selected from H or methyl;

E is -C(=O)-, -S(=O)_m-, -NR⁵S(=O)_m-, -NR⁵C(=O)-, -OC(=O)-;

R⁶ is a stable, optionally substituted, monocyclic or bicyclic, carbocycle or heterocycle wherein the or each ring has 4, 5 or 6 ring atoms and 0 to 3 hetero atoms selected from

S, O and N and wherein the optional substituents comprise 1 to 3 members selected from R₇;

R⁷ is independently selected from halo, oxo, nitrile, nitro, C₁-C₄ alkyl, -NRaRb, -XNRbR⁹, -NRbC₁-C₄alkylR⁹, NH₂CO-, X-R⁹, X-O-R⁹, O-X-R⁹, X-C(=O)R⁹, X-C(=O)NRaR⁹, X-NRbC(=O)R⁹, X-NHSO_mR⁹, X-S(=O)_mR⁹, X-C(=O)OR⁹, X-NRbC(=O)OR⁹;

R⁹ is independently H, C₁-C₄ alkyl, C₃-C₆ cycloalkyl, pyrrolidinyl, piperidinyl, morpholinyl, thiomorpholinyl, piperazinyl, indolinyl, pyranyl, thiopyranyl, furanyl, thienyl, pyrrolyl, oxazolyl, isoxazolyl, thiazolyl, imidazolyl, pyridinyl, pyrimidinyl, pyrazinyl, indolyl, phenyl,

any of which is optionally substituted with R₁₀;

R₁₀ is independently selected from hydroxy, -X-R⁹, -XNRaRb, -XNRbR⁹, -NRbC₁-C₄alkylR⁹, nitro, cyano, carboxy, oxo, C₁-C₄ alkyl, C₁-C₄-alkoxy, C₁-C₄ alkanoyl, carbamoyl;

X is independently a bond or C₁-C₄ alkyl;

Rb is selected from H, C₁-C₄ alkyl

m is independently 0, 1 or 2;

and pharmaceutically acceptable salts thereof.

Without in any way wishing to be bound by theory, or the ascription of tentative binding modes for specific variables, P1, P2 and P3 as used herein are provided for convenience only and have their conventional meanings and denote those portions of the inhibitor believed to fill the S1, S2 and S3 subsites respectively of the enzyme, where S1 is adjacent the cleavage site and S3 remote from the cleavage site.

Preferably the stereochemistry of the P1 group is as depicted in the partial structure below:

Preferably the halogen of R¹ and/or R² is chlorine and most preferably fluorine. It is currently preferred that R² is halo, especially fluorine and R¹ is H, but the invention

extends to compounds wherein R^1 is halo, especially F and R^2 is H or R^1 and R^2 are each F.

It will be appreciated that the P1 group may exist in alternative forms, such as

and the invention extends to all such alternative forms.

Preferably the stereochemistry of the P2 group corresponds to an L-amino acid as depicted in the partial structure below:

but the invention also extends to D-isomers.

The invention also includes all isomers and enantiomers at other chiral centres.

Currently preferred P2 groups include those wherein R^4 is H and wherein R^3 is iso-butyl. A further preferred P2 group is homo-t-butyl, that is $-\text{CH}_2\text{C}(\text{CH}_3)_3$

Alternative preferred P2 groups included those wherein R^3 and R^4 together define spirocycloalkyl, such as cyclopentyl, cycloheptyl and especially cyclohexyl.

If a P2 cycloalkyl is substituted, the substitution is typically para to the linkage to the backbone. Representative substituents include monofluoro, difluoro, monohydroxy, geminal hydroxyl & methyl substituents, monomethyl or geminal methyl.

Alternative P2 groups include those wherein R^3 and R^4 together

define a 6 membered, saturated heterocycle, wherein a hetero atom selected from O, S, $S(=O)_2$ or NR_x where X is H or methyl, situated at the position corresponding to para or meta to the point of attachment to the backbone.

- 5 Representative P2 groups in accordance with the two paragraphs immediately above include

Currently preferred P2 groups include

6

It is currently preferred that R⁵ is H.

Preferred E groups include -S(=O)_m-, especially -S(=O)₂-, and most preferably -C(=O)-.

5

Typically R⁶ is a monocyclic ring with 5 or especially 6 ring atoms, or a bicyclic ring structure comprising a 6 membered ring fused to a 4, 5 or 6 membered ring.

Typical R⁶ groups include saturated or unsaturated heterocycles or saturated or
 10 unsaturated carbocycles, any of which are optionally substituted as described above. Illustrative variants include C₃₋₈ cycloalkyl, phenyl, benzyl, tetrahydronaphthyl, indenyl, indanyl, heterocyclyl such as from azepanyl, azocanyl, pyrrolidinyl, piperidinyl, morpholinyl, thiomorpholinyl, piperazinyl, indolinyl, pyranyl, tetrahydropyranyl, tetrahydrothiopyranyl, thiopyranyl, furanyl, tetrahydrofuranlyl, thienyl, pyrrolyl, oxazolyl,
 15 isoxazolyl, thiazolyl, imidazolyl, pyridinyl, pyrimidinyl, pyrazinyl, pyridazinyl, tetrazolyl, pyrazolyl, indolyl, benzofuranlyl, benzothienyl, benzimidazolyl, benzthiazolyl, benzoxazolyl, benzisoxazolyl, quinolinyl, tetrahydroquinolinyl, isoquinolinyl, tetrahydroisoquinolinyl, quinazolinyl, tetrahydroquinazolinyl and quinoxalinyl, any of which may be substituted as described above.

20

The saturated heterocycle thus includes radicals such as pyrrolinyl, pyrrolidinyl, pyrazolinyl, pyrazolidinyl, piperidinyl, morpholinyl, thiomorpholinyl, pyranyl, thiopyranyl, piperazinyl, indolinyl, azetidyl, tetrahydropyranyl, tetrahydrothiopyranyl, tetrahydrofuranlyl, hexahydropyrimidinyl, hexahydropyridazinyl, 1,4,5,6-
 25 tetrahydropyrimidinylamine, dihydro-oxazolyl, 1,2-thiazinanyl-1,1-dioxide, 1,2,6-thiadiazinanyl-1,1-dioxide, isothiazolidinyl-1,1 -dioxide and imidazolidinyl-2,4-dione, whereas the unsaturated heterocycle include radicals such as furanyl, thienyl, pyrrolyl, oxazolyl, thiazolyl, imidazolyl, pyrazolyl, isoxazolyl, isothiazolyl, oxadiazolyl, triazolyl, tetrazolyl, thiadiazolyl, pyridinyl, pyridazinyl, pyrimidinyl, pyrazinyl, indolizinylyl, indolyl,

isindolyl. In each case the heterocycle may be condensed with a phenyl ring to form a bicyclic ring system.

Preferred monocyclic R⁶ groups include substituted pyridyl, substituted pyrimidyl, substituted phenyl, particularly phenyl substituted with a cyclic group such as pyrrolidine-1-yl, piperidine-1-yl, 4-methylpiperidin-1-yl, 4-(piperidin-3-ylmethyl)-piperidin-1-yl, morpholin-4-yl, 4-methylpiperazin-1-yl, 2-morpholin-4-yl-ethylamino, 2-morpholin-4-yl-ethoxy, 1-pyrid-2-ylmethylamino, piperazin-1-yl, piperid-4-yl or N-piperazinyl, N-substituted with Ra or piperidin-1-yl which is 4-substituted with -NRaRb. A phenyl R⁶ is conveniently substituted at the 3 or 4 position (para or meta), for example with such a cyclic group.

Alternative cyclic substituents to a monocyclic R⁶ (such as phenyl) include aryl groups such as phenyl or a 5 or 6 membered heteroaryl group such as thiophene, furyl, triazole, thiazole, diazole, pyrazole or pyrrolidine. Favoured cyclic substituents in this context include thiazol-2-yl, pyrid-3-yl and especially pyrid-2-yl, thien-2-yl or thiazol-5-yl. This cyclic substituent (ie R⁷) is typically bonded direct to such R⁶ species (ie X is a bond), but may also for example comprise an amine spacer such as -NH-, -N(Me), -CH₂NH-, -CH₂N(Me)-, a C₁-C₃alkyl spacer such as -CH₂- or a C₁-C₃-alkyloxy spacer such as ethyloxy

Any of the cyclic substituents to R⁶ in the immediately preceding paragraph may be substituted as described above with R¹⁰. For example a heterocycle R⁷ group such as thiazolyl can be substituted with C₁-C₄ alkyl such as methyl.

Preferably, any of the cyclic substituents to R⁶ in the two immediately preceding paragraphs may itself be substituted with a cyclic group (that is R⁷ comprises an R⁹ moiety) typically a saturated heterocyclic group such as piperidine, piperazine or morpholine, which saturated cyclic group is optionally substituted, for example with C₁-C₃ alkyl, fluoro, difluoro, C₁-C₃alkyloxy or C₁-C₃alkyloxyC₁-C₃alkyl. As provided in the definition of R⁷, this saturated cyclic group (ie R⁹) may be spaced from the R⁶ group by X (eg C₁-C₃alkyl), amine (eg -NH-), amide, sulphonamide etc, but is typically bonded directly or via methylene.

Representative R^9 groups in accordance with the immediately preceding paragraph include heterocycles such as pyrrolidine-1-yl, piperidine-1-yl, 4-methylpiperidin-1-yl, 4-(piperidin-3-ylmethyl)-piperidin-1-yl, morpholin-4-yl, 4-methylpiperazin-1-yl, 2-morpholin-4-yl-ethylamino, 2-morpholin-4-yl-ethoxy, 1-pyrid-2-ylmethylamino, piperazin-1-yl, piperid-4-yl or N-piperaziny, N-substituted with R_a or piperidin-1-yl which is 4-substituted with $-NR_aR_b$,

Currently preferred R^9 substituents include 4-substituted piperazin-4-yl, such as 4-methyl-piperazin-4-yl or 4-methoxyethyl-piperazin-4-yl, piperid-1-ylmethyl which is optionally 4-substituted with fluoro or difluoro or morpholinylmethyl.

Alternative preferred substituents to a monocyclic R^6 (such as phenyl) include $-NR_aR_b$, $-CH_2NR_aR_b$, C_1 - C_4 straight or branched alkyl or $-O-R^9$.

Representative R^6 groups thus include:

Further representative R^6 groups include

especially

where R_q and $R_{q'}$ are independently selected from H, C_1 - C_4 alkyl or C_1 - C_4 alkanoyl or together define an unsaturated 5-7 membered ring, such as piperidine, piperazine or

morpholine, which may in turn be substituted with groups corresponding to R^{10} , particularly C_1 - C_4 alkyl, fluoro or difluoro.

Currently preferred R^6 groups include

5

Representative bicyclic groups for R^6 include naphthylenyl, especially naphthylen-2-yl; benzo[1,3]dioxolyl, especially benzo[1,3]dioxol-5-yl,

benzofuranyl, especially benzofuran-2-yl, and especially C_1 - C_6 alkoxy substituted benzofuranyl, more especially 5-(2-piperazin-4-carboxylic acid tert-butyl ester-ethoxy) benzofuran-2-yl, 5-(2-morpholino-4-yl-ethoxy)-benzofuran-2-yl, 5-(2-piperazin-1-yl-ethoxy)benzofuran-2-yl, 5-(2-cyclohexyl-ethoxy)-benzofuran-2-yl;

7-methoxy-benzofuran-2-yl, 5-methoxy-benzofuran-2-yl, 5,6-dimethoxy-benzofuran-2-yl, especially halogen substituted benzofuranyl, more especially 5-fluoro-benzofuran-2-yl, 5,6-difluoro-benzofuran-2-yl, especially C_1 - C_6 alkyl substituted benzofuranyl, most

especially 3-methyl-benzofuran-2-yl; benzo[b]thiophenyl, especially benzo[b]thiophen-2-yl; especially C_1 - C_6 alkoxy substituted benzo[b]thiophenyl, more especially 5,6-dimethoxy- benzo[b]thiophen-2-yl, quinolinyl, especially quinolin-2-yl,

quinolin-3-yl, quinolin-4-yl, quinolin-6-yl, and quinolin-8-yl; quinoxaliny, especially quinoxalin-2-yl; 1,8-naphthyridinyl, especially 1,8- naphthyridin-2-yl; indolyl, especially

indol-2-yl, especially indol-6-yl, indol-5-yl, especially C_1 - C_6 alkyl substituted indolyl, more

20

especially N-methylindol-2-yl; furo[3,2-b]pyridinyl, especially furo[3,2-b]pyridin-2-yl, and C₁-C₆-alkyl substituted furo[3,2-b]pyridinyl, especially 3-methyl-furo[3,2-b]pyridin-2-yl; thieno[3,2-b]thiophene, especially thieno[3,2-b]thiophene-2-yl, more especially C₁-C₆alkyl substituted thieno[3,2-b]thiophene-2-yl, more especially

5 5-tert-butyl-3-methylthieno[3,2-b]thiophene-2-yl.

Favoured R⁶ groups include bicyclic rings such as naphthyl, quinoloyl, benzofuranyl, benzothienyl, indolyl and indolinyl, particularly where the linkage is to the 2 position of the ring. Favoured substituents to a bicyclic R⁶ group include pyrrolidine-1-yl, piperidine-1-yl, 4-methylpiperidin-1-yl, 4-(piperidin-3-ylmethyl)-piperidin-1-yl, morpholin-10 4-yl, 4-methylpiperazin-1-yl, 2-morpholin-4-yl-ethylamino, 2-morpholin-4-yl-ethyloxy, 1-pyrid-2-ylmethylamino, piperazin-1-yl, piperid-4-yl or N-piperazinyl, N-substituted with R_a or piperidin-1-yl which is 4-substituted with -NR_aR_b. Especially preferred substituents, particularly in conjunction with benzofuranyl include 2-morpholin-4-yl-ethyloxy and N-methyl-piperidin-4-yloxy and those defined below.

15 A currently favoured bicyclic R⁶ group is optionally substituted benzothiazol or benzofuryl or benzoxazolyl, including those wherein the substituent is -OR⁹ or -NR_bR⁹. For example, favoured R⁶ groups include benzofur-2-yl, unsubstituted or substituted in the 5 position with a saturated heterocycle such as piperidine, piperazine or morpholine, which is optionally substituted with C₁-C₃ alkyl and/or spaced from the benzofuryl by 20 oxy, methyloxy or ethyloxy. Particularly favoured benzofuryl R⁶ groups thus include:

Returning to formula II in general:

X is typically methylene or especially a bond.

C₁-C_n alkyl, where n is 4, on its own or within compound expressions such as C₁-C₄ alkoxy, includes methyl, ethyl, n-propyl, iso-propyl, n-butyl, iso-butyl, sec-butyl, t-butyl, cyclopropyl, methylcyclopropyl and the like, extended in a likewise fashion for other values of n. For example C₅ alkyl includes homo-t-butyl (-CH₂C(CH₃)₃).

Halogen or halo includes bromo, chloro and especially fluoro.

Haloalkyl means an alkyl group as defined above where at least one carbon atom bears 1 to 3 halogen atoms, preferably fluorine atoms. Representative haloalkyl group includes fluoromethyl, difluoromethyl, trifluoromethyl, 2, fluoroethyl, 2,2difluoroethyl, 2,2,2 trifluoroethyl and the like.

The P1 building block employed in the present invention represent novel compounds and forms an additional aspect of the invention. Accordingly, this further aspect of the invention provides compounds of the formula

where R1 and R2 are as defined above and PG is a nitrogen protecting group as defined below, especially formyl, acetyl, benzoyl, pivaloyl, t-butylacetyl, phenylsulfonyl, benzyl, Fmoc, t-butoxycarbonyl (BOC) and benzyloxycarbonyl (Cbz). This aspect of the invention further includes the corresponding unprotected amines (ie PG=H).

The preferred embodiment of this aspect of the invention comprises compounds of the formula

where PG is as described above.

The invention further embraces various novel P3 building blocks as illustrated in the examples below, as the acid or protected with a carboxy protecting group.

- 5 Favoured compounds of the invention include those permutations formed by independent selection of a P3, P2 and P1 member from each of Tables A, B and C:

Table A P1 groups

10 Table B P2 groups

Table C P3 groups

13

Additional aspects of the invention include a pharmaceutical composition comprising a compound as defined above and a pharmaceutically acceptable carrier or diluent therefor.

A further aspect of the invention is the use of a compound as defined above in the manufacture of a medicament for the treatment of disorders mediated by cathepsin K, such as:

- 10 osteoporosis,
- gingival diseases such as gingivitis and periodontitis,
- Paget's disease,
- hypercalcaemia of malignancy
- metabolic bone disease
- 15 diseases characterised by excessive cartilage or matrix degradation, such as
- osteoarthritis and rheumatoid arthritis,
- bone cancers including neoplasia,
- pain.
- 20 The compounds of the invention can form salts which form an additional aspect of the invention. Appropriate pharmaceutically acceptable salts of the compounds of Formula II include salts of organic acids, especially carboxylic acids, including but not limited to acetate, trifluoroacetate, lactate, gluconate, citrate, tartrate, maleate, malate, pantothenate, isethionate, adipate, alginate, aspartate, benzoate, butyrate, digluconate,
- 25 cyclopentananate, glucoheptanate, glycerophosphate, oxalate, heptanoate, hexanoate, fumarate, nicotinate, palmoate, pectinate, 3-phenylpropionate, picrate, pivalate, propionate, tartrate, lactobionate, pivate, camphorate, undecanoate and succinate, organic sulphonic acids such as methanesulphonate, ethanesulphonate, 2-hydroxyethane sulphonate, camphorsulphonate, 2-naphthalenesulphonate,

benzenesulphonate, p-chlorobenzenesulphonate and p-toluenesulphonate; and inorganic acids such as hydrochloride, hydrobromide, hydroiodide, sulphate, bisulphate, hemisulphate, thiocyanate, persulphate, phosphoric and sulphonic acids. The compounds of Formula II may in some cases be isolated as the hydrate.

5

It will be appreciated that the invention extends to prodrugs, solvates, complexes and other forms releasing a compound of formula II in vivo.

10

While it is possible for the active agent to be administered alone, it is preferable to present it as part of a pharmaceutical formulation. Such a formulation will comprise the above defined active agent together with one or more acceptable carriers/excipients and optionally other therapeutic ingredients. The carrier(s) must be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient.

15

20

The formulations include those suitable for rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration, but preferably the formulation is an orally administered formulation. The formulations may conveniently be presented in unit dosage form, e.g. tablets and sustained release capsules, and may be prepared by any methods well known in the art of pharmacy.

25

30

Such methods include the step of bringing into association the above defined active agent with the carrier. In general, the formulations are prepared by uniformly and intimately bringing into association the active agent with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product. The invention extends to methods for preparing a pharmaceutical composition comprising bringing a compound of Formula II or its pharmaceutically acceptable salt in conjunction or association with a pharmaceutically acceptable carrier or vehicle. If the manufacture of pharmaceutical formulations involves intimate mixing of pharmaceutical excipients and the active ingredient in salt form, then it is often preferred to use excipients which are non-basic in nature, i.e. either acidic or neutral.

Formulations for oral administration in the present invention may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active agent; as a powder or granules; as a solution or a suspension of the active agent in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water in oil liquid emulsion and as a bolus etc.

With regard to compositions for oral administration (e.g. tablets and capsules), the term suitable carrier includes vehicles such as common excipients e.g. binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, polyvinylpyrrolidone (Povidone), methylcellulose, ethylcellulose, sodium carboxymethylcellulose, hydroxypropylmethylcellulose, sucrose and starch; fillers and carriers, for example corn starch, gelatin, lactose, sucrose, microcrystalline cellulose, kaolin, mannitol, dicalcium phosphate, sodium chloride and alginic acid; and lubricants such as magnesium stearate, sodium stearate and other metallic stearates, glycerol stearate stearic acid, silicone fluid, talc waxes, oils and colloidal silica. Flavouring agents such as peppermint, oil of wintergreen, cherry flavouring or the like can also be used. It may be desirable to add a colouring agent to make the dosage form readily identifiable. Tablets may also be coated by methods well known in the art.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active agent in a free flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may be optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active agent.

Other formulations suitable for oral administration include lozenges comprising the active agent in a flavoured base, usually sucrose and acacia or tragacanth; pastilles comprising the active agent in an inert base such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active agent in a suitable liquid carrier.

The appropriate dosage for the compounds or formulations of the invention will depend upon the indication and the patient and is readily determined by conventional animal trials. Dosages providing intracellular (for inhibition of physiological proteases of the papain superfamily) concentrations of the order 0.01-100 μM , more preferably 0.01-10 μM , such as 0.1-25 μM are typically desirable and achievable.

Compounds of the invention are prepared by a variety of solution and solid phase chemistries.

The compounds are typically prepared as building blocks reflecting the P1, P2 and P3 moieties of the end product inhibitor. Without in any way wishing to be bound by theory, or the ascription of tentative binding modes for specific variables, the notional concepts P1, P2 and P3 as used herein are provided for convenience only and have substantially their conventional Schlecter & Berger meanings and denote those portions of the inhibitor believed to fill the S1, S2, and S3 subsites respectively of the enzyme, where S1 is adjacent the cleavage site and S3 remote from the cleavage site. Compounds defined by Formula I are intended to be within the scope of the invention, regardless of binding mode.

Broadly speaking the P1 building block will be an N-protected- 6-fluoro-3-oxo-hexahydro-furo[3,2-b]pyrrole, P2 will be an N-protected amino acid, whereas P3 typically comprises a capping group such as a substituted, heteroaroyl or aroyl moiety.

The suitably protected individual building blocks can first be prepared and subsequently coupled together i.e. $\text{P2} + \text{P1} \rightarrow \text{P2-P1}$. Alternatively, precursors of the building blocks can be coupled together and modified at a later stage of the synthesis of the inhibitor sequence. Further building blocks, precursors of building blocks or prefabricated bigger fragments of the desired structure, can then be coupled to the growing chain, e.g. $\text{R}^3\text{-E-P2}^* + \text{P1} \rightarrow \text{R}^3\text{-E-P2-P1}$ or $\text{R}^3\text{-E}^* + \text{P2-P1} \rightarrow \text{R}^3\text{-E-P2-P1}$, where * denotes an activated form.

Coupling between two amino acids, an amino acid and a peptide, or two peptide fragments can be carried out using standard coupling procedures such as the azide

method, mixed carbonic-carboxylic acid anhydride (isobutyl chloroformate) method, carbodiimide (dicyclohexylcarbodiimide, diisopropylcarbodiimide, or water-soluble carbodiimide) method, active ester (p-nitrophenyl ester, N-hydroxysuccinimide ester) method, Woodward reagent K-method, carbonyldiimidazole method, phosphorus reagents or oxidation-reduction methods. Some of these methods (especially the carbodiimide method) can be enhanced by adding 1-hydroxybenzotriazole or 4-DMAP. These coupling reactions can be performed in either solution (liquid phase) or solid phase.

More explicitly, the coupling step involves the dehydrative coupling of a free carboxyl of one reactant with the free amino group of the other reactant in the presence of a coupling agent to form a linking amide bond. Descriptions of such coupling agents are found in general textbooks on peptide chemistry, for example, M. Bodanszky, "Peptide Chemistry", 2nd rev ed., Springer-Verlag, Berlin, Germany, (1993) hereafter simply referred to as Bodanszky, the contents of which are hereby incorporated by reference. Examples of suitable coupling agents are N,N'-dicyclohexylcarbodiimide, 1-hydroxybenzotriazole in the presence of N,N'-dicyclohexylcarbodiimide or N-ethyl-N'-[3-dimethylamino]propyl carbodiimide. A practical and useful coupling agent is the commercially available (benzotriazol-1-yloxy)tris-(dimethylamino)phosphonium hexafluorophosphate, either by itself or in the presence of 1-hydroxybenzotriazole or 4-DMAP. Another practical and useful coupling agent is commercially available 2-(1H-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium tetrafluoroborate. Still another practical and useful coupling agent is commercially available O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate.

The coupling reaction is conducted in an inert solvent, e.g. dichloromethane, acetonitrile or dimethylformamide. An excess of a tertiary amine, e.g. diisopropylethylamine, N-methylmorpholine, N-methylpyrrolidine or 4-DMAP is added to maintain the reaction mixture at a pH of about 8. The reaction temperature usually ranges between 0 °C and 50 °C and the reaction time usually ranges between 15 min and 24 h.

The functional groups of the constituent non-natural amino acids generally must be protected during the coupling reactions to avoid formation of undesired bonds. The

protecting groups that can be used are listed in Greene, "Protective Groups in Organic Chemistry", John Wiley & Sons, New York (1981) and "The Peptides: Analysis, Synthesis, Biology", Vol. 3, Academic Press, New York (1981), hereafter referred to simply as Greene, the disclosures of which are hereby incorporated by reference.

5

The alpha-carboxyl group of the C-terminal residue is usually protected as an ester that can be cleaved to give the carboxylic acid. Protecting groups that can be used include 1) alkyl esters such as methyl, trimethylsilyl and t.butyl, 2) aralkyl esters such as benzyl and substituted benzyl, or 3) esters that can be cleaved by mild base or mild reductive means such as trichloroethyl and phenacyl esters.

10

The alpha-amino group of each amino acid to be coupled is typically N- protected. Any protecting group known in the art can be used. Examples of such groups include: 1) acyl groups such as formyl, trifluoroacetyl, phthalyl, and p-toluenesulfonyl; 2) aromatic carbamate groups such as benzyloxycarbonyl (Cbz or Z) and substituted benzyloxycarbonyls, and 9-fluorenylmethyloxycarbonyl (Fmoc); 3) aliphatic carbamate groups such as tertbutyloxycarbonyl (Boc), ethoxycarbonyl, diisopropylmethoxycarbonyl, and allyloxycarbonyl; 4) cyclic alkyl carbamate groups such as cyclopentyloxycarbonyl and adamantyloxycarbonyl; 5) alkyl groups such as triphenylmethyl and benzyl; 6) trialkylsilyl such as trimethylsilyl; and 7) thiol containing groups such as phenylthiocarbonyl and dithiasuccinoyl. The preferred alpha-amino protecting group is either Boc or Fmoc. Many amino acid derivatives suitably protected for peptide synthesis are commercially available.

15

20

25

30

The alpha-amino protecting group is typically cleaved prior to the next coupling step. When the Boc group is used, the methods of choice are trifluoroacetic acid, neat or in dichloromethane, or HCl in dioxane or in ethyl acetate. The resulting ammonium salt is then neutralized either prior to the coupling or in situ with basic solutions such as aqueous buffers, or tertiary amines in dichloromethane or acetonitrile or dimethylformamide. When the Fmoc group is used, the reagents of choice are piperidine or substituted piperidine in dimethylformamide, but any secondary amine can be used. The deprotection is carried out at a temperature between 0 °C and room temperature usually 20-22 °C.

Any of the natural or non-natural amino acids having side chain functionalities will typically be protected during the preparation of the peptide using any of the above described groups. Those skilled in the art will appreciate that the selection and use of appropriate protecting groups for these side chain functionalities depend upon the amino acid and presence of other protecting groups in the peptide. In the selection of such protecting groups it is desirable that the group is not removed during the deprotection and coupling of the alpha-amino group.

For example, when Boc is used as the alpha-amino protecting group, the following side chain protecting groups are suitable: p-toluenesulfonyl (tosyl) moieties can be used to protect the amino side chain of amino acids such as Lys and Arg; acetamidomethyl, benzyl (Bn), or tert-butylsulfonyl moieties can be used to protect the sulfide containing side chain of cysteine; benzyl (Bn) ethers can be used to protect the hydroxy containing side chains of serine, threonine or hydroxyproline; and benzyl esters can be used to protect the carboxy containing side chains of aspartic acid and glutamic acid.

When Fmoc is chosen for the alpha-amine protection, usually tert. butyl based protecting groups are acceptable. For instance, Boc can be used for lysine and arginine, tert.butyl ether for serine, threonine and hydroxyproline, and tert-butyl ester for aspartic acid and glutamic acid. Triphenylmethyl (Trityl) moiety can be used to protect the sulfide containing side chain of cysteine.

Once the inhibitor sequence is completed any protecting groups are removed in whatever manner is dictated by the choice of protecting groups. These procedures are well known to those skilled in the art.

The first stage in a synthesis of compounds of the general formula II is typically the preparation in solution of a functionalized P1 building block. Different nomenclature of compounds according to the present invention can be used. For convenience the carbohydrate nomenclature will generally be used herein. A typical scheme towards a bicyclic P1 group starts with the ring closure of a suitably protected intermediate which is available in 4 steps from 1,2:5,6-di-O-isopropylidene-D-allofuranose, described by Mayer zum Reckendorf, Chem. Ber. 101 (1968), 3802-3807, giving a precursor of 3S, 4R stereochemistry.

Scheme 1. a) H₂, Pd/C, methanol. b) benzylchloroformate, pyridine, dichloromethane

In Scheme 1 the azide group of derivative **1** is reduced for example by catalytic hydrogenation using palladium on charcoal or other catalysts suitable, in a suitable solvent such as an alcohol, like ethanol or methanol into the free amine. The obtained nucleophilic nitrogen reacts spontaneously, or optionally in the presence of a suitable base like such as triethyl amine or sodium acetate, with the C-6 position forming a 5,5-bicycle. The leaving group at C-6 is not limited to sulfonate esters, but also other leaving groups such as halogen could be used throughout the synthesis of compounds according to the present invention. The reduction of the azide residue into an amine could also be performed by other methods known from literature, such as treating the azide derivative with a trialkyl- or triarylphosphine followed by hydrolysis of the formed imine derivative. After the ring closure the amine may be N-protected with a suitable protecting group such as a carbamate, like benzyl carbamate of compound **3** or any other similar protecting group which is normally not cleaved with acid. Suitable protecting groups which can be found in: Protective groups in organic chemistry, 3rd edition, 1999, Theodora W. Greene and Peter G. M. Wuts (Wiley&sons).

For a 3R, 4S bicycle a similar approach could be used starting from 3-azido-3-deoxy-1,2:5,6-di-O-isopropylidene-D-gulofuranose which can be prepared as described in Tetrahedron Asymmetry, 10 (1999) 1855-1859. This intermediate can then be treated as described in Scheme 2.

Scheme 2. a) aq. acetic acid. b) p-toluenesulfonyl chloride, pyridine, DCM, c) H₂, Pd/C, methanol. d) benzylchloroformate, pyridine, dichloromethane.

- 5 Compound 4 can be treated with a mild acid, such as diluted acetic acid or similar, which can selectively hydrolyze the 5,6-acetal of compound 4, to obtain a diol. The primary alcohol can be selectively reacted with an alkyl- or arylsulfonyl chloride like p-toluenesulfonyl chloride to give compound 5. The azide group of derivative 5 is reduced for example by catalytic hydrogenation using palladium on charcoal or other catalysts suitable, in a suitable solvent such as an alcohol, like ethanol or methanol into the free amine. The obtained nucleophilic nitrogen reacts spontaneously, or optionally in the presence of a suitable base like such as triethyl amine or sodium acetate, with the C-6 position forming a 5,5-bicycle which can be N-protected with a suitable protecting group such as its benzyl carbamate (Cbz) to give compound 6.

15

Alternatively 3-azido-3-deoxy-1,2:5,6-di-O-isopropylidene-D-idofuranose (Bull. Chem. Soc. Japan, 57, 1(1984), 237-241) could be a suitable starting material for the 3R, 4S bicycle according to Scheme 3.

Scheme 3. a) aq. acetic acid. b) p-toluenesulfonyl chloride, pyridine, DCM, c) H₂, Pd/C, methanol. b) benzylchloroformate, pyridine, dichloromethane.

5 Compound 6 can be treated with a mild acid, such as diluted acetic acid or similar, which can selectively hydrolyze the 5,6-acetal of compound 6, to obtain a diol. The primary alcohol can be selectively reacted with an alkyl- or arylsulfonyl chloride like p-toluenesulfonyl chloride to give compound 7. The azide group of derivative 7 is reduced for example by catalytic hydrogenation using palladium on charcoal or other catalysts
10 suitable, in a suitable solvent such as an alcohol, like ethanol or methanol into the free amine. The obtained nucleophilic nitrogen reacts spontaneously, or optionally in the presence of a suitable base like such as triethyl amine or sodium acetate, with the C-6 position forming a 5,5-bicycle which can be N-protected with a suitable protecting group such as its benzyl carbamate (Cbz) to give compound 8.

15

The ring closure is not limited to the substrates shown above but could also be applied to derivatives as depicted in Scheme 4.

25

Scheme 4. a) reduction of azide into an amine followed by ring closure. b) protection of amine.

- 5 Rx in Scheme 4 may be chosen from methyl, trifluoromethyl, p-methylphenyl or similar residues present in readily available alkylsulfonylhalides, preferably a bulky Rx suitable for regioselective reaction on the primary alcohol of a diol as described in Chem. Ber. 101 (1968), 3802-3807. R_1' and R_2' are R^1 and R^2 as defined. Pg could be a suitable protecting group such as a carbamate, like benzyl carbamate or any similar protecting
- 10 group which is not normally cleaved with acid.

Further substrates for the ring closure reaction could be compounds depicted in Scheme 5.

26

Scheme 5. a) reduction of azide into an amine followed by ring closure. b) protection of amine (optional).

- 5 Rx in Scheme 5 can be chosen from methyl, trifluoromethyl, p-methylphenyl or similar residues present in readily available alkylsulfonylhalides, preferably a bulky Rx suitable for regioselective reaction on the primary alcohol of a diol as described in Chem. Ber. 101 (1968), 3802-3807. R^{1'} and R^{2'} are R¹ and R² as defined above. Ry can be hydrogen or a hydroxyl protective group, preferably an ether type protective group.
- 10 Preferably Ry is hydrogen. PG could be a suitable N-protecting group such as a carbamate, for derivatives in Scheme 5, Ry is typically hydrogen.

Other methodologies to obtain a 5,5-bicycle is disclosed by G. Lin and Z. Shi, Tetrahedron, 53, 4, 1369-1382, 1997.

15

Further modification of the 5,5-bicyclic compound obtained in scheme 1 is outlined in Scheme 6.

Scheme 6. a) benzyl bromide, sodium hydride, DMF. b) $\text{BF}_3 \cdot \text{Et}_2\text{O}$, Et_3SiH , DCM. c) H_2 , Pd/C, Boc_2O , 1:1 EtOAc-EtOH. d) pyridine, acetic anhydride. e) H_2 , Pd/C, EtOAc

- 5 Compound 9 is protected with a suitable acid stable protecting group such as substituted methyl ether, in particular a benzyl ether, by treating the mono-ol 9 with a base such as sodium hydride or sodium hydroxide in an aprotic solvent such as N,N-dimethylformamide (DMF) in the presence of the desired alkylating agent such as the benzyl halide, in particular benzyl bromide. The obtained material can then be reduced
- 10 into compound 10 according to methods described by G. J. Ewing and M. J. Robins, Org. Lett. 1, 4, 1999, 635-636, or by references therein. Preferably the reduction is performed with excess boron trifluoride etherate in the presence of a reducing agent such as trialkylsilane, in particular with excess triethylsilane in a suitable non-protic solvent such as dichloromethane. Catalytic hydrogenation of compound 10 using for
- 15 example palladium-on-charcoal in a suitable solvent or solvent mixture such as ethyl acetate-ethanol in a hydrogen atmosphere, in the presence of di-tert-butyl dicarbonate followed by treatment of the product with acetic anhydride in pyridine gives intermediate 11. By repeated catalytic hydrogenation, as described above, the mono-ol 12 is obtained.

20

A fluorine can be introduced on compound 12, and the bicyclic compound then N-deprotected according to Scheme 7.

28

Scheme 7. a) Deoxo-Fluor[®], dichloromethane. b) methanolic sodium methoxide. c) 1:1 dichloromethane-trifluoroacetic acid.

- 5 Compound 13 can be treated with a fluorinating agent such as [bis-(2-methoxyethyl)aminosulfur trifluoride] (Deoxo-Fluor[®]) or with similar fluorinating agents such as diethylaminosulfur trifluoride (DAST) which gives the product 14 with inversion of configuration at C-5. Compound 14 is then deacetylated by treatment for example
- 10 base such as sodium hydroxide or sodium carbonate, followed by N-deprotection using acidic conditions such as dichloromethane-trifluoroacetic acid solutions or other methods which could be found in: Protective Groups in Organic Chemistry, 3rd edition, 1999, Theodora W. Greene and Peter G. M. Wuts (Wiley & Sons).
- 15 Alternatively the epimeric fluorine can be obtained by treating derivative 9 above according to Scheme 8.

Scheme 8. a) diisopropylazodicarboxylate, benzoic acid, PPh_3 , THF. b) methanolic sodium methoxide. c) benzyl bromide, sodium hydride, DMF. d) $\text{BF}_3 \cdot \text{Et}_2\text{O}$, Et_3SiH , dichloromethane. e) H_2 , Pd/C, Boc_2O , 1:1 EtOAc-EtOH. f) pyridine, acetic anhydride. g) H_2 , Pd/C, EtOAc. h) Deoxo-Fluor[®], dichloromethane. i) methanolic sodium methoxide. j) 1:1 dichloromethane-trifluoroacetic acid.

Inversion of configuration at C-5 can be accomplished by reacting compound 16 under Mitsunobu conditions which gives a benzoate ester. Ester hydrolysis with methanolic sodium methoxide followed by treatment of the mono-ol with benzyl bromide provides benzyl protected epimer 17. Reaction steps d-j in Scheme 8 are as described for Schemes 6 and 7.

A further route to a "difluoro derivative" wherein R^1 and R^2 are fluoro is shown in Scheme 9.

Scheme 9. a) benzyl bromide, sodium hydride, DMF. b) Et_3SiH , $\text{BF}_3 \cdot \text{Et}_2\text{O}$ or trimethylsilyl trifluoromethanesulfonate, DCM. c) H_2 , Pd/C, Boc_2O , EtOAc-EtOH . d) benzoyl chloride, pyridine, DCM. e) H_2 , Pd/C, EtOAc . f) Bu_2SnO , toluene, reflux. g) benzyl bromide, cesium fluoride, DMF. h) Dess-Martin periodinane. i) Deoxo-Fluor® or diethylaminosulfur trifluoride, DCM. j) methanolic sodium methoxide. k) H_2 , Pd/C, EtOAc . l) p-toluenesulfonyl chloride, pyridine, DCM. m) DCM, trifluoroacetic acid. n) triethylamine, dichloromethane.

The synthesis of the P1 building block can be started from compound 21 (3-azido-3-deoxy-1,2-O-isopropylidene-D-allofuranose) which is described by Mayer zum Reckendorf, Chem. Ber. 101 (1968), 3802-3807. Treatment of compound 21 with a
5 benzylating agent like benzyl bromide or benzyl chloride in the presence of a base, such as sodium hydride or sodium hydroxide in a aprotic polar solvent, such as N,N-dimethylformamide gives derivative 22. Compound 22 is then treated with a trialkyl silane, such as triethyl silane, with an excess of a Lewis acid such as boron trifluoride etherate or trimethylsilyl trifluoromethanesulfonate, in a aprotic solvent such as
10 dichloromethane. The resulting azide can then be selectively reduced by catalytic hydrogenation using for example Palladium on charcoal in the presence of di-tert-butyl carbonate to obtain compound 23. Alternatively the azide could be reduced with other methods known from literature such as triphenylphosphine-water, followed by protection giving a suitable carbamate. In order to avoid problems with regioselectivity in the
15 following steps, compound 23 could be treated with an acylating agent such as an acyl chloride or acid anhydride, such as benzoyl chloride, in neat organic base such as pyridine or triethyl amine, or in a mixture of an aprotic solvent such as dichloromethane and a base to give compound 24. Catalytic hydrogenation of compound 24 as described above gives diol 25. Selective benzylation at the primary alcohol of compound 25 can
20 be accomplished by several methods known from the literature. In Scheme 9 the diol is refluxed with dibutyl tin oxide in a suitable solvent such as toluene to form a tin acetal. The tin acetal can then be reacted with a small excess of benzyl bromide and cesium fluoride in DMF giving the desired compound 26. Oxidation of 26 with a suitable oxidizing agent such as Dess-Martin periodinane in dichloromethane converts the
25 secondary alcohol into the keto compound 27 suitable to convert into the difluoride 28. This can be accomplished by treating compound 27 with an excess fluorinating agent such as Deoxo-Fluor®, or with diethylaminosulfur trifluoride (DAST), in an aprotic solvent such as dichloromethane or 1,2-dichloroethane. The benzoate ester of compound 28 can be cleaved with alkali such as methanolic sodium methoxide,
30 followed by debenylation using catalytic hydrogenation to obtain diol 29. Selective introduction of a sulfonate ester at the primary alcohol can be accomplished by treating the compound 29 with a small excess of alkyl- or arylsulfonyl chloride in the presence of a base such as pyridine in suitable solvent such as dichloromethane, adding the sulfonylating agent at reduced temperature and slowly increase up to room temperature,

which gives mono-ol 30. Treatment of compound 30 under acidic conditions such as mixtures of dichloromethane-trifluoroacetic acid liberates the amine, and treating the product with a base such as triethyl amine promotes the internal ring closure which gives building block 31.

5

Alternative routes to 5,5-bicycles are shown in Schemes 10 and 11.

Scheme 10. a) fluorinating agent. b) reduction of amine or N-deprotection, optionally followed by N-protection. c) reducing agent.

10

In Scheme 10 a derivative such as compound 32 (available as described above or with methods well known in the art) with the substituents at C-3 and C-4 in cis relationship, Lg being a leaving group such as halogen or a sulfonate ester, and with R equal to an azide or a nitrogen protected with a suitable N-protecting group, can be treated with a fluorinating agent such as mentioned above, producing compound 33. Upon liberating the masked amine with either reduction of the azide or by a suitable deprotection method, the amine could perform an intramolecular attack at C-6 producing a 5,5-bicycle with structure 34, which could optionally be N-protected (Pg = protecting group or hydrogen). Reduction of C-1 with a suitable reducing agent such as described above or with a similar reducing agent would give building block 35.

15

20

In Scheme 11 an alternative route to a difluoro-5,5-bicycle is depicted.

Scheme 11. a) oxidation. b) fluorinating agent. c) reduction of azide or N-deprotection, optionally followed by N-protection. d) reducing agent.

- 5 In Scheme 11 compound 36 (available as described above or with methods well known in the art) with the substituents at C-3 and C-4 in cis relationship, Lg being a leaving group such as halogen or a sulfonate ester, and with R equal to an azide or a nitrogen protected with a suitable protecting group, can be oxidized with a Swern-type reaction or other suitable methods which can give compound 37. Treatment of compound 37
- 10 according to Scheme 11 with an excess of fluorinating agent such as mentioned above, gives compound 38. Upon liberating the masked amine of 38 with either reduction of the azide or by a suitable deprotection method, the amine could perform an intramolecular attack at C-6 producing a 5,5-bicycle with structure 39, which could optionally be N-protected (Pg = protecting group or hydrogen). Reduction of C-1 with a suitable
- 15 reducing agent such as described above or with a similar reducing agent gives building block 40.

A convenient route to compounds wherein R1 or R2 is a halogen such as chloro is depicted in Scheme 12

Scheme 12

a) Thionyl chloride. b) methanolic sodium methoxide. c) 1:1 dichloromethane-trifluoroacetic acid. d) thionyl chloride, pyridine

The P1 building block is then elongated with the natural or non natural P2 amino acid and the P3 group by conventional solution or solid phase chemistries, such as those outlined or exemplified below, or disclosed in WO00/69855 or WO02/057270. P2 and P3 groups are either commercially available as enantiomers or resolvable from the racemate or obtainable using simple chemical transformations known to one skilled in the art. For example, 4-(methyl-piperazine-1-yl)-benzoic acid can be obtained using Buchwald chemistry (S. L. Buchwald & J. P. Wolfe, Journal of Organic Chemistry, 2000, 65, 1144) and subsequently elaborated. Other P3 cores such as 4-(1-piperidin-4-yl)-benzoic acid are prepared from 1-(4-phenyl-piperidine-1-yl)-ethanone using a Friedel-Crafts acylation reaction and subsequently elaborated using standard chemical transformations known to one skilled in the art. Alternatively, other P3 moieties, such as 5-[2-(4-morpholinyl)ethoxy]-2-benzofuran-2-carboxylic acid, are prepared using Mitsunobu reactions on solid phase as detailed by L. S. Richter & T. R. Gadek in Tetrahedron Lett., 1994, 35, 4705.

35

Scheme 13. Typical elongation of a cyclic ketone

Urethane compounds i.e. E is $-\text{OC}(=\text{O})-$ can be formed for example by reaction of an R₆ alcohol with the isocyanate of the P2 amino acid. The isocyanate, or equivalent reactive intermediate, can be formed by reaction of the amino group of the P2-amino acid with phosgene, or with dinitrophenylcarbonate in the presence of a suitable base, e.g. triethylamine. Alternatively they can be formed by reaction of the amino group of the P2 amino acid with a suitable chloroformate, e.g. benzylchloroformate.

Sulphonamide derivatives i.e. E = $\text{S}(=\text{O})_2-$ can be prepared by reaction of the amino group of the P2 amino acid with a suitable sulfonyl chloride in a solvent such as dichloromethane in the presence of a suitable base such as triethylamine or dimethylaminopyridine.

Sulphamide derivatives i.e. E = $\text{NRaS}(=\text{O})_2-$ can be prepared by reacting a suitable R₆ amine in a sulphonyl chloride solvent followed by reaction of the formed sulfamoyl chloride derivative with the amino group of the above mentioned R₄ amino acid in a

solvent such as dichloromethane in the presence of a suitable base such as triethylamine.

Alternatively the P1 building block as the hydroxyl may be elongated and subsequently
5 oxidised as shown in Scheme 14 and the Examples.

Scheme 14, Typical elongation of an hydroxylated P1 building block

- 10 The term "N-protecting group" or "N-protected" as used herein refers to those groups intended to protect the N-terminus of an amino acid or peptide or to protect an amino group against undesirable reactions during synthetic procedures. Commonly used N-

protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis" (John Wiley & Sons, New York, 1981), which is hereby incorporated by reference. N-protecting groups include acyl groups such as formyl, acetyl, propionyl, pivaloyl, t-butylacetyl, 2-chloroacetyl, 2-bromoacetyl, trifluoroacetyl, trichloroacetyl, phthalyl, o-nitrophenoxyacetyl, α -chlorobutyryl, benzoyl, 4-chlorobenzoyl, 4-bromobenzoyl, 4-nitrobenzoyl, and the like; sulfonyl groups such as benzenesulfonyl, p-toluenesulfonyl, and the like, carbamate forming groups such as benzyloxycarbonyl, p-chlorobenzyloxycarbonyl, p-methoxybenzyloxycarbonyl, p-nitrobenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl, p-bromobenzyloxycarbonyl, 3,4-dimethoxybenzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitro-4,5-dimethoxybenzyloxycarbonyl, 3,4,5-trimethoxybenzyloxycarbonyl, 1-(p-biphenyl)-1-methylethoxycarbonyl, α,α -dimethyl-3,5-dimethoxybenzyloxycarbonyl, benzhydryloxycarbonyl, t-butoxycarbonyl, diisopropylmethoxycarbonyl, isopropylloxycarbonyl, ethoxycarbonyl, methoxycarbonyl, allyloxycarbonyl, 2,2,2-trichloroethoxycarbonyl, phenoxycarbonyl, 4-nitrophenoxycarbonyl, fluorenyl-9-methoxycarbonyl, cyclopentylloxycarbonyl, adamantylloxycarbonyl, cyclohexylloxycarbonyl, phenylthiocarbonyl, and the like; alkyl groups such as benzyl, triphenylmethyl, benzyloxymethyl and the like; and silyl groups such as trimethylsilyl and the like. Favoured N-protecting groups include formyl, acetyl, benzoyl, pivaloyl, t-butylacetyl, phenylsulfonyl, benzyl, t-butoxycarbonyl (BOC) and benzyloxycarbonyl (Cbz).

Hydroxy and/or carboxy protecting groups are also extensively reviewed in Greene *ibid* and include ethers such as methyl, substituted methyl ethers such as methoxymethyl, methylthiomethyl, benzyloxymethyl, t-butoxymethyl, 2-methoxyethoxymethyl and the like, silyl ethers such as trimethylsilyl (TMS), t-butyldimethylsilyl (TBDMS) tribenzylsilyl, triphenylsilyl, t-butyldiphenylsilyl triisopropyl silyl and the like, substituted ethyl ethers such as 1-ethoxymethyl, 1-methyl-1-methoxyethyl, t-butyl, allyl, benzyl, p-methoxybenzyl, diphenylmethyl, triphenylmethyl and the like, aralkyl groups such as trityl, and pixyl (9-hydroxy-9-phenylxanthene derivatives, especially the chloride). Ester hydroxy protecting groups include esters such as formate, benzylformate, chloroacetate, methoxyacetate, phenoxyacetate, pivaloate, adamantate, mesitoate, benzoate and the like. Carbonate hydroxy protecting groups include methyl vinyl, allyl, cinnamyl, benzyl and the like.

Detailed Description of the Embodiments

Various embodiments of the invention will now be described by way of illustration only
 5 with reference to the following Examples.

Example 1Construction of P1 building block

10 Step a)

A mixture of 54 (5.2 g, 13.0 mmol), palladium-on-carbon (10%, Acros, 0.66 g) in
 methanol was hydrogenated at slight positive pressure. The hydrogen was changed 3
 15 times over a period of 1 h, after TLC (petroleum ether-ethyl acetate 7:3 and
 dichloromethane-methanol 9:1, staining with ammonium molybdate-cerium sulfate)
 indicated complete conversion of the starting material into a major non-UV active spot
 which colours AMC, and some weaker higher moving spots (dichloromethane-methanol
 9:1). The reaction mixture was then filtered through Celite and concentrated which gave
 20 crude compound 55.

To a suspension of the residue in dichloromethane (60 ml) and pyridine (3.2 ml, 40 mmol) at 0 °C was added benzylchloroformate (0.93 ml, 6.5 mmol). The reaction mixture was stirred at room temperature for 2 h after which additional pyridine (3 ml) and benzylchloroformate (0.8 ml) was added at 0 °C. The reaction mixture was then stirred at room temperature overnight, then diluted with dichloromethane (100 ml), washed successively with 1M aq. sulfuric acid (2 x 50 ml) and 1M aq. sodium hydrogen carbonate (1 x 50 ml), then dried (sodium sulfate), filtered and concentrated onto silica. Flash chromatography (diameter: 4 cm, YMC-gel: 50 g, packing eluent: ethyl acetate in petroleum ether 1:4) of the residue using ethyl acetate in petroleum ether 1:4 (350 ml), 2:3 (250 ml), 1:1 (250 ml), 3:2 (250 ml) and 3:1 (150 ml) gave compound 56 as a foamy syrup (2.71 g, 8.1 mmol, 62% over 2 steps) after drying in vacuum overnight.

NMR data (400 MHz, CDCl₃): ¹H, 1.33, 1.52 (2 s, 6H, C(CH₃)₂), 2.34 (2 d, 1H, -OH), 3.04 (m, 1H, H-6a), 3.97 (m, 1H, H-6b), 4.19 (m, 1H, H-5), 4.33 (m, 1H, H-3), 4.68, 4.84 (2 d, 1H, H-2), 4.79 (t, 1H, H-4), 5.08-5.24 (m, 2H, CH₂Ph), 5.86 (br s, 1H, H-1), 7.30-7.42 (m, 5H, Ar-H).

Step b)

20

To a stirred suspension of sodium hydride (60% in mineral oil, Aldrich, 0.34 g, 8.4 mmol) and compound 56 (2.17 g, 6.47 mmol) in dimethylformamide (30 ml) was added benzyl bromide (0.81 mmol, 6.8 mmol) during 5 minutes. After stirring 1 h (TLC: ethyl acetate in petroleum ether 2:3), methanol (approx 2 ml) was added to destroy excess reagent, then immediately partitioned between ethyl acetate (180 ml) and water (150 ml). The organic layer was washed with water (3 x 100 ml), then dried (sodium sulfate), filtered and concentrated onto silica. Flash chromatography (diameter: 4 cm, YMC-gel: 40 g, packing eluent: ethyl acetate in petroleum ether 1:4) of the residue using ethyl

25

acetate in petroleum ether 1:4 (100 ml), 3:7 (250 ml) and 2:3 (250 ml) gave a colourless syrup (2.7 g, 6.35 mmol, 98%) after drying in vacuum overnight.

NMR data (400 MHz, CDCl_3): ^1H , 1.31 (s, 3H, $\text{C}(\text{CH}_3)(\text{CH}_3)$), 1.51 (d, 3H, $\text{C}(\text{CH}_3)(\text{CH}_3)$),
 5 3.29 (m, 1H, H-6a), 3.78-3.96 (m, 2H, H-5 and H-6b), 4.22 (dd, 1H, H-3), 4.64, 4.84 (2
 M, 4H, H-2, H-4 and CH_2Ph), 5.07-5.22 (m, 1H, CH_2Ph), 5.94 (m, 1H, H-1), 7.28-7.39
 (m, 10H, Ar-H).

Step c)

To a stirred solution of compound 7 (2.635 g, 6.19 mmol) in dichloromethane (28 ml)
 and triethyl silane (9.9 ml, 61.9 mmol) at 0 °C was added borontrifluoride etherate (7.9
 ml, 61.9 mmol) in one portion. The reaction mixture was then stirred at rt for 24 h (TLC:
 15 petroleum ether-ethyl acetate 4:1 and ethyl acetate-toluene 3:2), then 1M aq. sodium
 hydrogen carbonate (40 ml) and some solid sodium hydrogen carbonate was carefully
 added until bubbling stopped. The resulting mixture was partitioned between
 dichloromethane (100 ml) and water (100 ml). The organic layer was washed with 1M
 aq. sodium hydrogen carbonate (1 x 100 ml) and brine (1 x 100 ml), then dried (sodium
 20 sulfate), filtered and concentrated onto silica. Flash chromatography (diameter: 4 cm,
 YMC-gel: 48 g, packing eluent: ethyl acetate-toluene 3:2) of the residue using ethyl
 acetate in toluene 3:2 (750 ml) gave a colorless hard syrup (1.38 g, 3.74 mmol, 60%) of
 about 85-90% purity according to TLC. LR-MS: Calcd for $\text{C}_{21}\text{H}_{24}\text{NO}_5$: 370.2. Found:
 370.0 $[\text{M}+\text{H}]$.

Step d)

A mixture of compound 58 (1.38 g, 3.74 mmol), palladium-on-carbon (Acros, 10%, 0.12 g) and di-tert-butyl-dicarbonate (0.82 g, 3.7 mmol) in ethyl acetate (50 ml) was hydrogenated at slight overpressure. The hydrogen was changed 2 times over a period of 1 h and the reaction was monitored by LC-MS. After 1 h, additional palladium-on-carbon (0.1 g) was added and the reaction mixture was treated with hydrogen for 1 more hour. The reaction mixture was then filtered through Celite and concentrated. The residue was treated with 2:1 pyridine-acetic anhydride (18 ml) overnight, and then concentrated. The residue was redissolved in dichloromethane (60 ml) and was washed successively with 1M aq. sulfuric acid (2 x 40 ml) and 1M aq. sodium hydrogen carbonate (1 x 40 ml), and then dried (sodium sulfate) filtered and concentrated. Flash chromatography (diameter: 3 cm, YMC-gel: 20 g, packing eluent: ethyl acetate in toluene 1:4) of the residue (dissolved in toluene-ethyl acetate 4:1) using ethyl acetate in toluene 1:4 (200 ml) and 1:3 (150 ml) gave a colourless syrup (1.13 g, 3.0 mmol, 80%) after drying in vacuum overnight.

NMR data (400 MHz, CDCl_3): ^1H , 1.45 (s, 9H, $\text{C}(\text{CH}_3)_3$), 2.08 (s, 3H, COCH_3), 3.10 (m, 1H, H-6a), 3.74-3.99 (m, 3H, H-1a, H-5 and H-6b), 4.11 (m, 1H, H-1b), 4.16-4.74 (m, 4H H-3, H-4 and CH_2Ph), 5.31 (m, 1H, H-2), 7.28-7.40 (m, 5H, Ar-H).

Step e)

A mixture of compound 60 (1.08 g, 2.86 mmol) and palladium-on-carbon (10%, 0.15 g) in ethyl acetate (30 ml) was hydrogenated at slight over pressure for 2 h (TLC: toluene-

ethyl acetate 4:1 and 1:1), then filtered through Celite and concentrated. The mixture was concentrated from dichloromethane (3 x 10 ml), then dissolved in dichloromethane and to the solution was added bis-(2-methoxyethyl)aminosulphur trifluoride (50% in THF, 2.12 ml, 2 eq.) at 0 °C. After stirring at rt overnight additional bis(2-methoxyethyl)aminosulphur trifluoride (50% in THF, 2 ml) was added and the reaction mixture was stirred at rt for another night (TLC: toluene-ethyl acetate 1:1, ninhydrine staining), then 1M aq. sodium hydrogen carbonate was added carefully until bubbling stopped. The resulting mixture was diluted with dichloromethane (50 ml), and the organic layer was washed once with 1M aq. sodium hydrogen carbonate (40 ml), then dried (sodium sulfate), filtered and concentrated. Flash chromatography (diameter: 3 cm, Silica: 25 g, packing eluent: toluene-ethyl acetate 4:1) of the residue (dissolved in toluene-ethyl acetate 4:1) using toluene-ethyl acetate 4:1 gave compound 62 (0.49 g, 1.7 mmol, 59 %) as a colourless syrup after drying in vacuum overnight. Some starting material and sulphur intermediate could be recovered from the reaction mixture.

LR-MS: Calcd for $C_9H_{13}FNO_5$: 234.1. Found: 234.0 [M+2H-*t*-Butyl].

Example 2

Elongation with a typical P2

Step a)

To a solution of compound 62 (0.49 g, 1.7 mmol) in methanol (9.5 ml) was added 0.5 M methanolic sodium methoxide (1 ml), then stirred at rt for 30 min (TLC: Toluene-ethyl acetate 3:2, ninhydrine staining). Methanol washed Dowex W X 8 (50-100 mesh, H^+ -form) was carefully added (pH was monitored by pH-paper) was added until neutral, then the mixture was filtered and concentrated. The residue was dissolved in dichloromethane and trifluoroacetic acid was added at 0 °C. The reaction mixture was then stirred at rt for 55 min (TLC: dichloromethane-methanol 9:1, ninhydrine staining), then concentrated. Column chromatography (diameter: 2 cm, silica: 15 g, packing

eluent: dichloromethane-methanol 95:5) of the residue (dissolved in dichloromethane-methanol 95:5) using methanol in dichloromethane 5:95 (150 ml), 7:93 (100 ml) and 1:9 (200 ml) gave a hard syrup which crystallized upon standing (0.39 g, 1.50 mmol, 88%).

- 5 NMR data (400 MHz, DMSO-d₆): ¹H, 3.34, 3.44 (2 dd, 1H, H-6a), 3.60-3.70 (m, 2H, H-1a and H-6b), 3.89 (dd, 1H, H-1b), 4.15 (d, 1H, H-3), 4.51 (br s, 1H, H-2), 4.76 (dd, 1H, H-4), 5.26 (dd, ²J_{H,F} = 48.3 Hz, H-5).

Step b)

To a stirred solution of compound 64 (0.34 g, 1.30 mmol), N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide hydrochloride (0.28 g, 1.43 mmol), 1-hydroxybenzotriazole hydrate (0.22 g) and N-(*tert*-Butoxycarbonyl)-L-leucine monohydrate (0.34 g, 1.37 mmol) in DMF (10 ml) was added triethylamine (0.54 ml, 3.9 mmol), then stirred at rt for 24 h. The reaction mixture was the partitioned between 10% aq. citric acid (30 ml) and ethyl acetate (10 ml). The water layer was extracted with ethyl acetate (3 x 10 ml), then the organic layers were combined, and washed successively with water (1 x 20 ml) and 1M aq. sodium hydrogen carbonate (3 x 20 ml), then dried (sodium sulfate), filtered and concentrated onto silica. Flash chromatography with ethyl acetate in petroleum ether (40-60 %, stepwise gradient elution) of the residue gave 15 (0.35 g, 0.98 mmol, 75%) as a colourless amorphous solid.

LR-MS: Calcd for C₁₃H₂₂FN₂O₅: 305.1. Found: 305.1 [M+2H-*t*-Butyl].

Example 3

Elongation with a typical P3

44

To a solution of compound 65 (0.11 g, 0.31 mmol) in dichloromethane (2 ml) at 0 °C was added trifluoroacetic acid (2 ml), then stirred at rt for 45 min. The reaction mixture was then concentrated and co-concentrated with toluene. To a suspension of the residue, N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide hydrochloride (0.064 g, 0.34 mmol), 1-Hydroxybenzotriazole hydrate (0.051 g) and benzo[b]furan-2-carboxylic acid (0.052 g, 0.32 mmol) in DMF (3 ml) was added triethylamine (0.13 ml, 0.9 mmol), then stirred at rt for 24 h. The reaction mixture was then concentrated. The residue was then partitioned between 10% aq. citric acid (30 ml) and ethyl acetate (10 ml). The water layer was extracted with ethyl acetate (2 x 10 ml), then the organic layers were combined, and washed successively with water (1 x 10 ml) and 1M aq. sodium hydrogen carbonate (3 x 10 ml), then dried (sodium sulfate), filtered and concentrated onto silica. Flash chromatography with ethyl acetate in petroleum ether (50-60 %, stepwise gradient elution) of the residue gave 66 (0.11 g, 0.27 mmol, 89 %) as a colourless glassy solid.

LR-MS: Calcd for $C_{21}H_{26}FN_2O_5$: 405.2. Found: 405.1 [M+H].

20 Example 4

Oxidation to P1 ketone.

To a stirred solution of compound 66 (0.10 g, 0.25 mmol) in dichloromethane (4 ml) at rt was added Dess-Martin periodinane (0.12 g, 0.28 mmol). After stirring for 90 minutes the reaction mixture was diluted with dichloromethane (10 ml), washed with 1:1 1M aq. sodium hydrogen carbonate- 10 % aq. sodiumthiosulfate (4 x 10 ml), then dried (sodium sulfate), filtered and concentrated onto silica. Flash chromatography with ethyl acetate in petroleum ether (50-60 %, stepwise gradient elution) of the residue gave 67 (0.072 g, 0.18 mmol, 71 %) as a colourless foam. Compound 67 is obtained as a mixture of geometrical isomers (rotamers) and their hydrates.

- 10 LR-MS: Calcd for $C_{21}H_{24}FN_2O_5$: 403.2. Found: 403.0 [M+H]. A NMR sample of the ketoforms of 67 was obtained as follows; 5 mg of compound 67 (mixture of geometrical isomers and hydrate forms with the ratio: hydrate/keto 6:4) was dissolved in DMSO-d₆, then heated up to 100 °C in the NMR apparatus and then allowed to reach 50 °C upon which NMR indicated only trace amounts of the hydrate forms and the ratio of the
- 15 rotamers were 2:1.

NMR data (500 MHz, DMSO-d₆, 50 °C): ¹H, 0.90-1.04 (m, 4 x CH₃, major and minor forms), 1.39-1.82 (m, 2 x CH₂CH(CH₃)₂ and 2 x CH₂CH(CH₃)₂, major and minor forms), 3.56 (m, H-6a, minor), 3.82 (m, H-6A, major), 3.97-4.25 (m, 4 x H-1, major and minor forms and H-6b, minor), 4.37 (dd, H-6b, major), 4.62 (d, H-3, minor), 4.79 (m, H, major), 4.84 (d, H-3, major), 4.94 (m, H-4, major), 5.12 (m, H-4, minor), 5.15-5.34 (m, H-5 major and H-5 minor, H minor, J_{H,F} major = 49.1 Hz, J_{H,F} minor = 49.4 Hz), 7.35 (t, 1H, Ar-H), 7.47 (t, 1H, Ar-H), 7.57-7.70 (m, 2H, Ar-H), 7.78 (d, 1H, Ar-H), 8.18 (d, -NH, minor), 8.70 (d, -NH, major).

25

Example 5

An alternative P3

Step a)

To a solution of compound 55 (0.11 g, 0.32 mmol) in dichloromethane (2 ml) at 0 °C was added trifluoroacetic acid (2 ml). After stirring for 45 min at rt (TLC: petroleum ether-ethyl acetate 1:1 and ethyl acetate-methanol-acetic acid-water 40:3:3:2), the reaction mixture was concentrated and co-concentrated from toluene (3 x 5 ml). To a suspension of the residue, 4-(dimethylamino)benzoic acid (0.055 g, 0.33 mmol), N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide hydrochloride (0.067 g, 0.35 mmol) and 1-hydroxybenzotriazole hydrate (0.053 g) in DMF (3 ml) was added triethylamine (0.13 ml, 0.95 mmol), then stirred at rt overnight (TLC: petroleum ether-ethyl acetate 2:3 and ethyl acetate-methanol-acetic acid-water 40:3:3:2). The reaction mixture was then concentrated, partitioned between 8% aq. KH_2PO_4 (30 ml) and ethyl acetate (10 ml). The water layer was extracted with ethyl acetate (3 x 10 ml), and the combined organic layers were washed with water (1 x 10 ml) and 1M aq. sodium hydrogen carbonate (3 x 10 ml), then dried (sodium sulphate), filtered and concentrated. The residue was redissolved in dichloromethane and concentrated onto silica. Flash chromatography (diameter: 2 cm, Silica: 8 g, packing eluent: petroleum ether-ethyl acetate 1:1) of the residue (stepwise gradient elution, ethyl acetate in petroleum ether 50-100%) gave a colourless foam (0.10 g, 0.25 mmol, 80%).

LR-MS: Calcd for $\text{C}_{21}\text{H}_{31}\text{FN}_3\text{O}_4$: 408.2. Found: 408.1 $[\text{M}+\text{H}]$.

Step b)

To a stirred solution of the mono-ol 68 (0.096 g, 0.24 mol) in dichloromethane at rt was added Dess-Martin periodinane (0.11 g, 0.26 mmol). The reaction mixture turned red and after stirring for approximately 35 min (TLC: petroleum ether-ethyl acetate 2:3), the reaction mixture was diluted with dichloromethane (10 ml), washed with 1:1 1M aq. sodium hydrogen carbonate- 10 % aq. sodiumthiosulfate (4 x 10 ml), then dried (sodium sulfate), filtered and concentrated onto silica. Flash chromatography (diameter: 2 cm, Silica: 7 g, Packing eluent: petroleum ether-ethyl acetate 1:1) of the residue (stepwise

gradient elution, ethyl acetate in petroleum ether 50-100%) gave a colourless foam (0.039 g, 0.10 mmol, 41%).

LR-MS: Calcd for $C_{21}H_{27}FN_3O_4$: 404.2. Found: 404.1 [M-H].

5

Example 6

An alternative P3

Step a)

10

55

70

To a solution of compound 55 (0.12 g, 0.32 mmol) in dichloromethane (2 ml) at 0 °C was added trifluoroacetic acid (2 ml), then stirred at rt for 45 min. The reaction mixture was then concentrated and co-concentrated with toluene (3 x 5 ml). To a suspension of
15 the residue, N-ethyl-N'-(3-dimethylaminopropyl) carbodiimide hydrochloride (0.068 g, 0.36 mmol), 1-hydroxybenzotriazole hydrate (0.055 g) and 4-phenoxybenzoic acid (0.073 g, 0.34 mmol) in DMF (3 ml) was added triethylamine (0.14 ml, 0.97 mmol), then stirred at rt for 24 h. The reaction mixture was then concentrated. The residue was then
20 partitioned between 10% aq. citric acid (30 ml) and ethyl acetate (10 ml). The water layer was extracted with ethyl acetate (2 x 10 ml), then the organic layers were combined, and washed successively with water (1 x 10 ml) and 1M aq. sodium hydrogen carbonate (3 x 10 ml), then dried (sodium sulfate), filtered and concentrated onto silica. Flash chromatography of the residue with 1:1 ethyl acetate in petroleum ether gave colourless hard syrup (0.14 g, 0.30 mmol, 91%).

25

LR-MS: Calcd for $C_{25}H_{30}FN_2O_5$: 457.2. Found: 457.2 [M+H].

48

Step b)

To a stirred solution of the mono-ol (0.128 g, 0.28 mmol) in dichloromethane (4 ml) at rt
 5 was added Dess-Martin periodinane (0.12 g, 0.28 mmol). After stirring for 90 minutes
 the reaction mixture was diluted with dichloromethane (10 ml), washed with 1:1 1M aq.
 sodium hydrogen carbonate- 10 % aq. sodiumthiosulfate (4 x 10 ml), then dried (sodium
 sulfate), filtered and concentrated onto silica. Flash chromatography with ethyl acetate
 in petroleum ether (50-60 %, stepwise gradient elution) of the residue gave 71 (0.072 g,
 10 0.18 mmol, 71 %) as a colourless foam.

LR-MS: Calcd for $C_{21}H_{28}FN_2O_5$: 455.2. Found: 455.1 [M+H].

Example 7

15 An alternative P1 epimer.

Step a)

20

To a stirred solution of compound (60) (1.58g, 4.19mmol) in methanol (20mL) was
 added a solution of 0.5 M sodium methoxide in methanol (5mL) at room temperature,

then stirred for 40 min. The reaction mixture was then neutralized with Dowex 50 WX 8 (H^+ -form), filtered, added triethylamine until slight alkaline, then concentrated and concentrated from toluene (2 x 20mL). To a stirred solution of the residue and imidazole (0.43g, 6.28mmol) in DMF (10mL) at 0 °C was added *tert*-Butyldimethylchlorosilane (0.76g, 5.02mmol), then stirred at room temperature overnight. The reaction mixture was then diluted with ethyl acetate (100mL), washed successively with 10% aq. citric acid (3 x 50mL) and 1M aq. sodium hydrogen carbonate (3 x 50mL), dried (sodium sulphate), filtered and concentrated onto silica. Column chromatography (stepwise gradient elution, ethyl acetate in toluene, 5-20%) of the residue afforded the fully protected intermediate as a syrup (1.86g). A mixture of palladium on charcoal (Aldrich 10%, 0.28g) and the intermediate obtained above (1.80g, 4.00mmol) in ethyl acetate (40mL) was hydrogenated at slight overpressure for 1 h, then filtered through celite and concentrated. The material crystallized upon drying in vacuum to afford 72 as needles (1.34g, 90%).

NMR data (400 MHz, $CDCl_3$): 1H , delta 0.14 (m, 6H, $Si(CH_3)_2$), 0.90 (m, 9H, $SiC(CH_3)_3$), 1.48 (m, 9H, $C(CH_3)_3$), 2.53 (m, 1H, OH), 2.78 (dd, 1H, - H-6A), 3.67-4.05 (m, 3H, H-1A, H-1B and H-6B), 4.05-4.21 (m, 2H, H-3 and H-5), 4.35-4.50 (2 brs, 1H, H-2), 4.57 (m, 1H, H-4).

Step b)

To a stirred solution of (72) (1.068g, 2.97mmol), benzoic acid (0.50g, 4.46mmol) and triphenylphosphine (1.17g, 4.46mmol) in THF (15 mL) at 0 °C was added dropwise a solution of diisopropyl azodicarboxylate (0.88mL, 4.46mmol) in THF (5mL) during 20 minutes. The reaction mixture was then stirred at room temperature overnight, then

50

concentrated onto silica. Flash chromatography of the residue using petroleum ether-ethyl acetate 9:1 as eluent, gave a colorless syrup (1.34g, 97%).

NMR data (400 MHz, CDCl₃): 1H, delta 0.08-0.21 (m, 6H, Si(CH₃)₂), 0.90 (s, 9H, SiC(CH₃)₃), 1.42-1.56 (m, 9H, C(CH₃)₃), 3.48 (m, 1H, H-6A), 3.70-4.01 (m, 3H, H-1A, H-1B, H-6B minor and major), 4.21, 4.30 (2d, 1H, H-3), 4.44, 4.56 (2 brs, 1H, H-2), 4.72 (m, 1H, H-4), 5.34 (d, 1H, H-5), 7.45 (t, 2H, Ar-H), 7.58 (t, 1H, Ar-H), 8.00 (d, 2H, Ar-H).

Step c)

To a stirred solution of (73) (1.34g, 2.89mmol) in methanol (6mL) was added a solution of 0.5 M sodium methoxide in methanol (6mL) at room temperature, then stirred for 15 min. The reaction mixture was then neutralized with Dowex 50 WX 8 (H⁺-form) and filtered. The obtained solution was added a solution obtained similarly as above starting from (II) (0.187g, 0.40mmol), then concentrated. Flash chromatography of the residue using toluene-ethyl acetate 3:2 as eluent gave 74 as a colorless syrup which crystallized upon drying in vacuum (1.091g, 92%).

NMR data (400 MHz, CDCl₃): 1H, delta 0.06-0.20 (m, 6H, Si(CH₃)₂), 0.89 (s, 9H, SiC(CH₃)₃), 1.42-1.54 (m, 9H, C(CH₃)₃), 2.03 (brs, 1H, OH), 3.28 (dd, 1H, H-6A), 3.53-3.79 (m, 3H, H-1A, H-1B, H-6B), 4.19 and 4.34-4.56 (2 m, 4H, H-2, H-3, H-4 and H-5).

Step d)

51

To a stirred solution of (74) (0.428g, 1.19mmol) in dichloromethane (10mL) in a Teflon coated flask was added Deoxofluor (50% in THF, 0.53mL) at room temperature resulting in a slight temperature increase. The reaction mixture was stirred at room temperature for 72 h, then diluted with dichloromethane (20mL), washed with 1M aq. sodium hydrogen carbonate (2 x 20mL), dried (sodium sulphate), filtered and concentrated onto silica. Flash chromatography of the residue using petroleum ether-ethyl acetate 9:1 as eluent gave (IV) as a colorless oil (0.118g, 27%).

NMR data (400 MHz, CDCl₃): 1H, delta 0.08-0.20 (m, 6H, Si(CH₃)₂), 0.89 (s, 9H, SiC(CH₃)₃), 1.42-1.53 (m, 9H, C(CH₃)₃), 3.26 and 3.36 (2 dd, 1H, H-6A), 3.64 (m, 1H, H-1A), 3.73-4.04 (m, 3H, H-1B, H-6B), 4.20 (dd, 1H, H-3*), 4.40, 4.51 (2 s, 1H, H-2), 4.69 (m, 1H, H-4*) 4.86, 4.98 (2 brs, 1H, H-5). * Could be interchanged.

Step e)

To a stirred solution of (75) (0.229g, 0.63mmol) in THF (8mL) was added 1M tetrabutylammonium fluoride in THF (0.70mL), then stirred at room temperature for 40 min. The reaction mixture was then concentrated onto silica. Column chromatography of the residue using toluene-ethyl acetate 1:1 as eluent gave 75 as a colorless hard syrup (0.150g, 96%).

NMR data (400 MHz, CDCl₃): 1H, delta 1.46-1.53 (m, 9H, C(CH₃)₃), 2.70 (d, 0.3H, OH-minor), 3.26-3.46 (m, 1.7H, H-6A and OH-major), 3.75-4.04 (m, 3H, H-1A, H-1B and H-6B), 4.29, 4.34 (2d, 1H, H-3* minor and major), 4.43, 4.50 (2 brs, 1H, H-2 minor and major), 4.74 (m, 1H, H-4*), 4.89, 5.02 (2 brs, 1H, H-5).

52

Step f)

To a solution of (75) (0.099g, 0.40mmol) in dichloromethane (2mL) at 0 °C, was added
5 trifluoroacetic acid (2mL), then stirred at room temperature for 35 min, then
concentrated and concentrated from toluene (3 x 5mL). To a suspension of the residue,
1-hydroxybenzotrazole hydrate (0.067g, 0.44mmol), N-ethyl-N'-(3-
dimethylaminopropyl)carbodiimide x HCl (0.084g, 0.44mmol) and N-(*tert*-
Butoxycarbonyl)-L-leucine monohydrate (0.105g, 0.42mmol) in DMF (4mL) was added
10 triethylamine (0.17mL, 1.2mmol), then stirred at room temperature overnight. The
reaction was then concentrated into half the volume, diluted with ethyl acetate (25mL),
washed successively with 10% aq. citric acid (3 x 15mL), and 1M aq. sodium hydrogen
carbonate (3 x 15mL), dried (sodium sulphate), filtered and concentrated. Column
chromatography of the residue using ethyl acetate-toluene 3:2 afforded (76) as a
15 colorless hard syrup (0.137g, 95%).

NMR data (400 MHz, CDCl₃, selected signals): 1H, delta 0.891.01 (m, 6H, C(CH₃)₂),
4.98, 5.07 (2 dd, 1H, H-5major and H-5 minor).

LR-MS: Calcd for C₁₇H₃₀FN₂O₅: 361.2. Found: 361.1 [M+H].

20

Step g)

To a solution of (76) (0.137g, 0.38mmol) in dichloromethane at 0 °C was added TFA,
25 then stirred at room temperature for 30 min, then concentrated and concentrated from
toluene (3 x 5 mL). To a suspension of the residue, 1-hydroxybenzotrazole hydrate

(0.064g, 0.42mmol), N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide x HCl (0.080g, 0.42mmol) and benzo[b]furan-2-carboxylic acid (0.065g, 0.40mmol) in DMF (3mL) was added triethylamine (0.16mL, 1.2mmol), then stirred at room temperature overnight. The reaction was then concentrated into half the volume, diluted with ethyl acetate (25mL), washed successively with 10% aq. citric acid (3 x 15mL), and 1M aq. sodium hydrogen carbonate (3 x 15mL), dried (sodium sulphate), filtered and concentrated. Column chromatography of the residue using ethyl acetate-toluene 3:2 afforded (77) as a colorless hard syrup (0.148g, 96%).

10 LR-MS: Calcd for $C_{21}H_{26}FN_2O_5$: 405.2. Found: 405.1 [M+H].

Step h)

15 To a stirred solution of (77) (0.148g, 0.37mmol) in dichloromethane at room temperature was added Dess-Martin periodinane (0.171g, 0.40mmol). After stirring for 2 h, the reaction mixture was diluted with dichloromethane (20mL), then washed with 1:1 1M aq. sodium hydrogen carbonate/10% aq. sodium thiosulphate (3 x 12mL), dried (sodium sulphate), filtered and concentrated. Column chromatography of the residue (stepwise
20 gradient elution, ethyl acetate in toluene, 40-50%) afforded (VIII) as a colorless foam (0.105g, 71%).

NMR data (100 MHz, $CDCl_3$, selected signals): ^{13}C , δ 206.7 and 206.5 (C=O major and minor).

25 LR-MS: Calcd for $C_{21}H_{24}FN_2O_5$: 403.2. Found: 403.1 [M+H].

Example 8

Additional cathepsin K inhibitors

Compounds 8.1 - 8.13 & 8.15 - 8.20 depicted in the table below were synthesised by successively coupling the N-protected P2 and P3 acids itemised in the table, to the P1 building block of Example 1 using the solid phase methodology outlined below. Compound 8.14 was synthesised in solution phase as outlined below. The construction of P2 and P3 building blocks not readily accessible from commercial sources appears below.

Table 1

| No. | Structure | P2 | P3 building block | MS data |
|-----|---|----|--|---------------------------|
| 8.1 |  | A | Ac ₂ O | 301 [M+H] ⁺ |

P2 building blocks

| A | B | C |
|---|---|---|
|  |  |  |

- 5 Solid phase synthesis of 8.1 - 8.13 & 8.15 - 8.67 was generally carried out using Murphy's linker methodology using known chemistries as described in WO02/88106. The ketone function of the FmocNH bicycle was derivatised as an acid labile semicarbazone which provided a carboxylic acid for attachment to the aminomethyl functionalised polymer support resin using HBTU, HOBT and NMM. After Fmoc removal
- 10 the corresponding P2 Fmoc acid was coupled on where the symmetric anhydride was preformed. Coupling was first carried out for 8 h, and then repeated with fresh reagents overnight. After Fmoc removal the P3 acids were introduced using standard coupling conditions. Washing, drying and cleavage from the resin provided the crude desired material which was purified either by column chromatography or preparative hplc.
- 15 Compounds which required modified procedures are described below.

1H-Indole-2-carboxylic acid [1-(6-fluoro-3-oxo-hexahydrofuro[3,2-b]pyrrole-4-carbonyl)-3-methyl-butyl]-amide (Example 8.6)

To the resin bound H₂N-L-Leu-P1 (150 mg, 0.03 mmol) was added a solution of indole-2-carboxylic acid (24.2 mg, 0.15 mmol) in DMF (1.0 mL). A solution of 1,3-diisopropylcarbodiimide (19 mg, 0.15 mmol) and 1-hydroxybenzotriazole hydrate (23 mg, 0.15 mmol) in DMF (1 mL) was then added. The reaction was agitated overnight and then washed with DMF (7 x 10 mL), MeOH (5 x 10 mL) and TBME (5 x 10 mL). After drying under vacuum for 17 h, the product was cleaved from the resin by suspension in 10 mL of 95: 5 TFA: water for 45 mins. The filtrate was then concentrated under N₂ stream, purified by semi preparative HPLC and then freeze dried to give the title compound as a white solid. Compounds were characterised by HPLC, ¹H NMR and MS which showed both the ketone and hydrate forms to be present.

15 4-Piperidin-4-yl benzoic acid (Example 8.9)

4-Phenylpiperidine (10.0 g, 62 mmol) and pyridine (5.74 mL, 71 mmol) were dissolved in DCM (80 mL) and cooled to 0 °C. A solution of acetyl chloride (4.00 mL, 71 mmol) in DCM (20 mL) was added drop wise to the above solution. The mixture was then stirred for 2 h at RT and when deemed to be complete by hplc, extracted with water, dried and concentrated *in vacuo* to afford a light yellow oil (10.6 g, 84%) which solidified on standing and was used without further purification. The yellow oil (10.6 g, 52.2 mmol) was dissolved in DCM and cooled to – 78 °C and treated with oxalyl chloride (18.3 mL, 209 mmol) drop wise followed by the addition of aluminium chloride (20.9 g, 157 mmol) in portions. When the addition was complete, the flask was placed in an ice-salt bath, and the mixture stirred at – 20 °C for 3h and then at RT overnight. The mixture was then poured onto ice-water and extracted with DCM (100 mL x 3), dried and concentrated *in vacuo*. The residue was dissolved in aq. NaOH (2N) and HCl (6N) was added at 0 °C to acidify the solution to pH 5. The precipitate (7.9 g) was filtered off and washed with water (200 mL). The residue was then suspended in 6N HCl and heated at reflux for 18h. The solvent was evaporated and the residue was recrystallised from ethanol. Crystals were filtered off and provided the title compound (5.05 g, 63%).

4-(5-Piperidin-1-ylmethyl-thiophen-2-yl)benzoic acid (Example 8.15)

5-Bromo-2-thiophenecarboxaldehyde (10 mmol) and piperidine (10 mmol) were mixed in THF (10 mL) and dibutyltin dichloride (0.2 mmol) was added. After stirring at RT for 5 minutes, phenylsilane (11 mmol) was added and the reaction allowed to stir at room temperature for a further 17 h. The reaction was then concentrated *in vacuo* and the residue purified by flash chromatography (silica gel, DCM) to give 1-(5-bromo-thiophen-2-ylmethyl)-piperidine: $m/z = 260, 262$ in MS ES⁺ as a golden oil which was used directly in the subsequent step. A reaction tube containing a magnetic stirrer bar was charged with 4-carboxyphenylboronic acid (0.05 mmol), the thiophene bromide (0.05 mmol), Pd(PPh₃)₄ (0.025 mmol), acetonitrile (2 mL) and 1M Na₂CO₃ (aq) (2 mL). The reaction tube was then sealed and heated by microwave irradiation (100W, 4 mins) to 150 °C and held at that temperature for 10 mins. After being allowed to cool to room temperature the reaction were acidified to pH 1 with 1M HCl and the resulting precipitate filtered off. This crude product was then passed through a silica plug to remove any inorganic species and concentrated to give a the titel compound as a brown powder $m/z = 304$ in MS ES⁺, which was characterised by hplc and MS and used in the next step without any further purification.

4-(5-Morpholin-4-ylmethyl-thiophen-2-yl)benzoic acid (Example 8.16)

To synthesise 4-(5-morpholin-4-ylmethyl-thiophen-2-yl)benzoic acid, the piperidine was substituted by morpholine in the previous experimental.

5-[2-(4,4-Difluoro-piperidin-1-yl)-ethoxy]-benzofuran-2-carboxylic acid (Example 8.17)

To a solution of 4,4-difluoropiperidine hydrochloride (1 g, 6.3 mmol) in THF (20 mL) was added methylbromoacetate (0.63 mL, 6.6 mmol) and triethylamine (2.65 mL, 19.0 mmol). The reaction was heated at reflux for 4 h. The reaction was diluted with water (50 mL) and the product extracted with ethyl acetate (3 × 20 mL). The combined organic fractions were washed with brine, dried over magnesium sulphate and concentrated *in vacuo* to yield (4,4-difluoropiperidin-1-yl)acetic acid methyl ester as a brown oil (1.17g, 96%). MS 194 (M + H)⁺. To a solution of (4,4-difluoropiperidin-1-yl)acetic acid methyl ester (1.17 g, 6.1 mmol) in THF (15 mL) at 0 °C was added portion wise lithium aluminium hydride (0.46 g, 12.2 mmol). Once the effervescence had ceased the reaction was heated at 60 °C for 1.5 h. The reaction was quenched with water (10 mL) followed by sodium hydroxide solution (2N, 10 mL) then water (10 mL). The reaction

was filtered and the filtrate extracted with ethyl acetate (3 × 20 mL). The combined organic fractions were washed with brine, dried over magnesium sulphate and concentrated *in vacuo* to yield 2-(4,4-difluoropiperidin-1-yl)-ethanol as a brown oil (0.99 g, 99%). MS 166 (M + H)⁺. To a solution of diisopropylazodicarboxylate (0.36 mL, 1.82 mmol) in DCM (20 mL) was added polymer supported triphenylphosphine (728 mg, 2.18 mmol). The reaction was stirred at RT for 10 min. 5-Hydroxybenzofuran-2-carboxylic acid ethyl ester (0.25 g, 1.21 mmol) and 2-(4,4-difluoropiperidin-1-yl)-ethanol (210 mg, 1.27 mmol) were added and the reaction stirred at RT for 16 h. The reaction was filtered and the filtrate concentrated *in vacuo*. The product was purified on silica eluting with 50 % tert-butyl methyl ether in n-heptane to yield 5-[2-(4,4-difluoropiperidin-1-yl)ethoxy]benzofuran-2-carboxylic acid ethyl ester as a yellow solid (375 mg, 88%). MS 354 (M + H)⁺. To a solution of 5-[2-(4,4-difluoropiperidin-1-yl)ethoxy]benzofuran-2-carboxylic acid ethyl ester (375 mg, 1.06 mmol) in THF (5 mL) and water (1 mL) was added lithium hydroxide (34 mg, 2.12 mmol). The reaction was stirred at RT for 16 h. The THF was removed *in vacuo* and the remaining aqueous solution dried overnight in a freeze dryer to yield the crude title compound as a brown solid. MS 326 (M + H, 5.3 min) and used for coupling onto H₂N-Leu-P1 without any further purification.

5-[2-(4-Trifluoromethyl-piperidin-1-yl)-ethoxy]-benzofuran-2-carboxylic acid (Example 8.18)

To a solution of 4-trifluoromethylpiperidine hydrochloride (1 g, 5.3 mmol) in THF (20 mL) was added methylbromoacetate (0.52 mL, 5.5 mmol) and triethylamine (2.2 mL, 15.8 mmol). The reaction was heated at reflux for 4 h and then diluted with water (50 mL) and the product extracted with ethyl acetate (3 × 20 mL). The combined organic fractions were washed with brine, dried over magnesium sulphate and concentrated *in vacuo* to yield (4-trifluoromethylpiperidin-1-yl)acetic acid methyl ester as a brown oil (1.19 g, 98%). MS 226 (M + H)⁺. To a solution of (4-trifluoromethylpiperidin-1-yl)acetic acid methyl ester (1.19 g, 5.3 mmol) in THF (15 mL) at 0 °C was added portion wise lithium aluminium hydride (0.4 g, 10.6 mmol). Once the effervescence had ceased the reaction was heated at 60 °C for 1.5 h. The reaction was quenched with water (10 mL) followed by sodium hydroxide solution (2N, 10 mL) then water (10 mL). The reaction was filtered and the filtrate extracted with ethyl acetate (3 × 20 mL). The combined organic fractions were washed with brine, dried over magnesium sulphate and concentrated *in vacuo* to yield 2-(4-trifluoromethylpiperidin-1-yl)-ethanol as a brown oil

(1.0 g, 99%). MS 198 (M + H)⁺. To a solution of diisopropylazodicarboxylate (0.58 mL, 2.28 mmol) in DCM (20 mL) was added polymer supported triphenylphosphine (1.14 g, 3.4 mmol). The reaction was stirred at RT for 10 mins. 5-Hydroxybenzofuran-2-carboxylic acid ethyl ester (0.47 g, 2.3 mmol) and 2-(4-trifluoromethylpiperidin-1-yl)-ethanol (0.45 g, 2.28 mmol) were added and the reaction stirred at RT for 16 h. The reaction was filtered and the filtrate concentrated *in vacuo*. The product was purified on silica eluting with 50 % tert-butyl methyl ether in n-heptane to yield 5-[2-(4-trifluoromethylpiperidin-1-yl)ethoxy]benzofuran-2-carboxylic acid ethyl ester as a yellow solid (548 mg, 62%). MS 386 (M + H)⁺. To a solution of 5-[2-(4-trifluoromethylpiperidin-1-yl)ethoxy]benzofuran-2-carboxylic acid ethyl ester (548 mg, 1.42 mmol) in THF (5 mL) and water (1 mL) was added lithium hydroxide (45 mg, 2.84 mmol). The reaction was stirred at RT for 16 h. The THF was removed *in vacuo* and the remaining aqueous solution dried overnight in a freeze dryer to yield the crude title compound as a brown solid. MS 358 (M + H)⁺ which was used directly for coupling with H₂N-Leu-P1.

4-[2-(4-Methyl-piperazin-1-yl)-thiazol-4-yl]-benzoic acid (Examples 8.19 & 8.20)

To thiocarbonyldiimidazole (2 g, 11.5 mmol) in THF (30 mL) at RT was added N-methylpiperazine (1.00 g, 10 mmol) drop wise. The reaction was stirred at RT for 2 h and then at 55 °C for 1 h. The reaction was cooled to RT and 20 mL of THF was removed *in vacuo*. 2M NH₃ (10 mL) in MeOH was added and the reaction stirred for 15 h. A further 2M NH₃ (10 mL) in MeOH was added and the reaction maintained at 55 °C for 8 h. A pale yellow precipitate (1.00 g) was observed and filtered off, dried and used directly in the next step. The thiourea (0.84 g, 5.2 mmol) was dissolved in EtOH (30 mL) and 4-(2-bromo-acetyl)-benzoic acid (1.28 g, 5.2 mmol) was added. The reaction was heated at reflux for 3 h. The reaction was cooled to RT and the solid filtered off. The solid was washed with Et₂O and dried thoroughly. This procedure provided the title compound as a pale yellow solid (1.23 g, 77 %).

[1-(6-Fluoro-3-oxo-hexahydro-furo[3,2-b]pyrrole-4-carbonyl)-cyclohexyl]-carbamic acid 9H-fluoren-9-ylmethyl ester (Example 8.20)

Fmoc-1-amino-1-cyclohexane carboxylic acid (0.300 mg, 0.82 mmol) was dissolved in DCM (8 mL) and DAST (1 mL, 8.2 mmol) was added. After 1.5 h the starting material was consumed and H₂O (5 mL) was added drop wise with care. The organic layer was removed, dried (Na₂SO₄) and concentrated *in vacuo* to afford a pale brown solid (0.287

g, 96 %). This material was used crude in the next step. (1-Fluorocarbonyl-cyclohexyl)-carbamic acid 9H-fluoren-9-ylmethyl ester (0.050 g, 0.135 mmol) was dissolved in DMF (1 mL) and added to H₂N-P1 in DMF (1 mL). NMM (0.027 g, 0.27 mmol) was added and the reaction left overnight. The resin was filtered off to remove spent reagents and fresh reagents were added and the reaction repeated for a further 24 h. After washing with DMF (10 mL x 10) and DCM (10 mL x 10) the title compound (loading equivalent to 50% yield) was obtained bound to resin.

[1-(6-Fluoro-3-oxo-hexahydro-furo[3,2-b]pyrrole-4-carbonyl)-3-methyl-butyl]-carbamic acid benzyl ester (Example 8.14)

Example 8.14 was prepared in solution rather than on solid phase.

6-Fluoro-3-hydroxy-hexahydro-furo[3,2-b]pyrrole-4-carboxylic acid tert-butyl ester (0.200 g, 0.81 mmol) was dissolved in DCM (4 mL) at 0 °C and TFA (4 mL) added. After stirring at 0 –4 °C for 1 h, the solvent was evaporated *in vacuo* and the residue left under high vacuum for 4 h to afford a brown oil. The residue was dissolved in DMF (5 mL) and WSC.HCl (171 mg, 0.89 mmol), HOBt (137 mg, 1.01 mmol), Cbz-Leu-OH (226 mg, 0.85 mmol) and Et₃N (337 µl, 2.43 mmol) added. After stirring at room temperature overnight, the reaction mixture was concentrated *in vacuo*, dissolved in EtOAc (10 mL), washed with H₂O (5 mL) and saturated NaHCO₃ solution (5 mL), dried (Na₂SO₄) and evaporated *in vacuo* to afford a colourless oil (242 mg; [M+H]⁺ 395). [1-(6-Fluoro-3-hydroxy-hexahydro-furo[3,2-b]pyrrole-4-carbonyl)-3-methyl-butyl]-carbamic acid benzyl ester (242 mg, 0.62 mmol) was dissolved in dry DCM (8 mL) and Dess-Martin periodinane (261 mg, 0.62 mmol) added. The reaction immediately turned light brown. After stirring at room temperature for 2.5 h, the yellow solution was diluted with DCM (8 mL) and washed with saturated NaHCO₃ solution (5 mL), dried (Na₂SO₄) and evaporated *in vacuo* to afford a yellow residue. Purification by column chromatography (EtOAc: heptane; 1:2) yielded the title compound as a colourless oil, 147 mg; [M+H]⁺ 393.

4-Thiocarbamoyl-piperazine-1-carboxylic acid tert-butyl ester (Example 8.21)

To a solution of piperazine-1-carboxylic acid tert-butyl ester (32.2 mmol) in tetrahydrofuran (60 ml) was added thiocarbonyldiimidazole (37.0 mmol). The reaction was stirred at RT for 2 h then heated at 55°C for 1 h. The reaction was concentrated *in vacuo* to approximately half the volume and methanolic ammonia added (7N, 107.4 mmol). The reaction was heated at 55°C for 16 h. The reaction was concentrated *in vacuo* to approximately half the volume and cooled to 0°C at which point the product precipitated from solution. The product was collected by filtration to yield the title compound as a white solid (3.3 g). ¹H NMR (400MHz, d₆-DMSO) 1.40 (9H, s), 3.32 (4H, s), 3.71 (4H, s), 7.42 (1H, s).

4-[4-(4-Carboxy-phenyl)-thiazol-2-yl]-piperazine-1-carboxylic acid tert-butyl ester

To a suspension of 4-thiocarbamoyl-piperazine-1-carboxylic acid tert-butyl ester (13.3 mmol) in ethanol (60 ml) was added 4-(2-bromoacetyl)-benzoic acid (13.3 mmol) and 4-methylmorpholine (13.9 mmol). The reaction was heated at reflux for 2.5 h. The reaction was concentrated *in vacuo* and the solid washed with water (200 ml) to yield the title compound as a white solid (3.9 g). ¹H NMR (400MHz, CDCl₃) 1.45 (9H, s), 3.58 (8H, m), 4.86 (1H, s), 6.95 (1H, s), 7.97 (2H, d, *J* 8 Hz), 8.1 (2H, d, *J* 8 Hz).

4-{2-[4-(2-Methoxy-ethyl)-piperazin-1-yl]-thiazol-4-yl}-benzoic acid

4-[4-(4-Carboxy-phenyl)-thiazol-2-yl]-piperazine-1-carboxylic acid tert-butyl ester (5.0 mmol) was dissolved in hydrochloric acid in dioxane (4N, 25 ml) and the reaction stirred at RT for 2 h. The reaction was concentrated *in vacuo* to yield 4-(2-piperazin-1-yl-thiazol-4-yl)-benzoic acid. Trimethoxyethane (6.5 mmol) was dissolved in aqueous hydrochloric acid (1N, 10 ml) and the reaction heated at 50°C for 1.5 h. The reaction was allowed to cool to RT and was then added to a suspension of 4-(2-piperazin-1-yl-thiazol-4-yl)-benzoic acid (5.0 mmol) in acetonitrile (25 ml) and sodium acetate buffer (1N, pH 5.5, 10ml). The reaction was stirred at RT for 1.5 h. Sodium cyanoborohydride (6.5 mol) was added and the reaction stirred at RT for 16 h. The reaction was concentrated *in vacuo* and the product purified by flash chromatography (silica gel, 10% methanol in *dichloromethane*) to give the title product as a colourless oil (0.9 g). *m/z* = 348 (100% M+H) in MS ES+.

4-[1-(5-Bromo-thiophen-2-yl)-ethyl]-morpholine (Example 8.22)

To a solution of morpholine (1.20 mmol) in titanium (IV) isopropoxide (1.95 mmol) was added 2-acetyl-5-bromothiophene (1.20 mmol). The reaction was heated in a

microwave at 150°C for 5 minutes. Sodium borohydride (1.95 mmol) was added and the reaction stirred at RT for 16 h. The reaction was diluted with sodium hydroxide solution (2N, 10 ml) and the solids formed removed by filtration. The filtrate was extracted with ethylacetate (3 × 20 ml), the combined organics were washed with brine and dried over magnesium sulphate. The product was purified by flash chromatography (silica gel, 10-20% ethylacetate in *iso*-hexane) to give the title product as a brown oil: $m/z = 276$ (100%, M+H), 278 (100%, M+H) in MS ES+.

4-[5-(1-Morpholin-4-yl-ethyl)-thiophen-2-yl]-benzoic acid

4-[1-(5-Bromo-thiophen-2-yl)-ethyl]-morpholine (0.36 mmol), 4-methoxycarbonylphenylboronic acid (0.43 mmol) and sodium carbonate (1.09 mmol) were suspended in dioxane:water (2 ml, 2:1). Nitrogen gas was bubbled through the reaction for 5 minutes then tetrakis(triphenylphosphine)palladium(0) (0.04 mmol) added. The reaction was heated in a microwave at 150 °C for 10 min. The reaction was concentrated *in vacuo* and the product was purified by flash chromatography (silica gel, 10% methanol in dichloromethane) to give the title product as a brown oil: $m/z = 318$ (50% M+H), 231 (100%, M+H-morpholine) in MS ES+.

4-[[1-(1-Methylimidazol-2-yl)methyl]amino]benzoic acid (Example 8.23)

1-Methyl-2-imidazolecarboxaldehyde (5.0 mmol) and methyl-4-aminobenzoate (5.0 mmol) were mixed in MeOH (7 mL). Acetic acid (0.3 mL) was added and the mixture stirred for 30 minutes at room temperature. The reaction mixture was cooled, sodium cyanoborohydride (5.0 mmol) was added and the reaction allowed to stir at room temperature for a further 17 h. The reaction mixture was then concentrated under vacuum and partitioned between H₂O and EtOAc. The aqueous layer was extracted with EtOAc, and the combined organic layers were washed with H₂O, brine, dried over MgSO₄ and the solvent removed under vacuum. The residue was purified by flash chromatography (silica gel, 5% MeOH in DCM) to give methyl 4-[[1-(1-methylimidazol-2-yl)methyl]amino]benzoate : $m/z = 246$ in MS ES+ as a pale yellow solid which was used directly in the subsequent step.

To a solution of methyl ester (2.5 mmol) in 1,4-dioxane (5 mL) was added 1M aqueous KOH solution (5.5 mmol) and the reaction mixture stirred for 18 h. The reaction mixture was neutralised to pH 7 with 1M HCl and concentrated by N₂ stream. The product was resuspended in water and lyophilised to give 4-[[1-(1-methylimidazol-2-yl)methyl]amino]

benzoic acid : m/z 232 in MS ES+ as a white solid which was used directly in the subsequent step.

4-[5-(1-Morpholin-4-yl-ethyl)-furan-2-yl]-benzoic acid (Example 8.25)

2-Acetylfuran (20 mmol) and morpholine (20 mmol) were added to neat titanium isopropoxide (32 mmol) and the reaction stirred under N₂ at room temperature for 3h. Methanol (90 ml) was then added followed by the careful portionwise addition of NaBH₄ (32 mmol). After stirring at room temperature for 10 mins, the reaction was quenched by addition of 0.1M NaOH and the resultant mixture filtered through a celite pad. The filtrate was extracted twice with DCM, dried over Na₂SO₄ and concentrated *in-vacuo*.

Flash chromatography of the residue (silica, 5 to 20% EtOAc in Heptane) yielded pure 4-(1-furan-2-yl-ethyl)-morpholine as a golden oil: m/z in MS ES+ = 182 [M+H]⁺, 2.76mmol, 14% yield.

4-(1-furan-2-yl-ethyl)-morpholine (1.1 mmol) was taken up in DCM (5 ml) and stirred at 0°C. Nitrogen was passed through the reaction vessel and bubbled out through a

Dreschel bottle containing a saturated aqueous solution of sodium thiosulphate, whilst bromine (1.54mmol in 2ml DCM) was added dropwise. After addition the reaction was stirred at room temperature for 2h, then diluted with more DCM, washed twice with 2M Na₂CO₃ solution, dried over Na₂SO₄ and concentrated *in-vacuo*. After purification by flash chromatography (silica, 5 to 10% EtOAc in hexane), 4-[1-(5-bromo-furan-2-yl)-ethyl]-morpholine was obtained as a golden oil: m/z in MS ES+ = 260, 262 [M+H]⁺, 0.46mmol, 42% yield.

4-[1-(5-bromo-furan-2-yl)-ethyl]-morpholine (0.54mmol) was taken up in 7ml toluene and 4-carboxymethylphenylboronic acid (0.54mmol) was added as a solution in 0.7ml of EtOH. 12ml of 2M aqueous Na₂CO₃ solution was added, followed by Pd(PPh₃)₄

(0.054mmol). Reaction was stirred at 70°C for 17h under a nitrogen atmosphere and then cooled to room temperature and extracted with DCM (x2). Combined organic layers were washed with brine, concentrated *in vacuo* and the residue purified by flash chromatography (silica, 20-50% EtOAc in hexane). This furnished the pure 4-[5-(1-Morpholin-4-yl-ethyl)-furan-2-yl]-benzoic acid methyl ester as a powdery grey solid : m/z in MS ES+ = 316 [M+H]⁺, 0.08mmol, 15% yield.

This ester (0.08mmol) was heated to 70°C in 18% HCl for 2h at which point HPLC showed all the starting material to have been hydrolysed. The reaction was cooled and

the product that precipitated out of solution was collected by filtration as a white solid and used directly in the next step.

4-(2-Methyl-pyridin-3-yloxy)-benzoic acid (Example 8.26)

- 5 A reaction tube containing a magnetic stirrer bar was charged with ethyl-4-fluorobenzoate (1 mmol), 2-methyl-3-pyridol (1.0 mmol), potassium carbonate (1.08 mmol) and DMF (2 ml). The reaction tube was then sealed and heated by microwave irradiation (100W, 4 mins) to 150 °C and held at that temperature for 80 mins. The solution was filtered to remove the insoluble potassium carbonate and then
- 10 concentrated *in vacuo*. The residue was purified by preparative HPLC and freeze dried to give 4-(2-Methyl-pyridin-3-yloxy)-benzoic acid ethyl ester as a white solid which was hydrolysed by 6N aqueous HCl solution heated by microwave irradiation (200W) for 3 mins at 150 °C. The solution was freeze dried to give to 63 mg of hydrochloride salt of the title compound as a white powder $m/z = 229$ in MS ES⁺, which was characterised
- 15 by HPLC and MS.

4-[2-(1-Dimethylamino-ethyl)-thiazol-4-yl]-benzoic acid (Example 8.27)

- 4-{2-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-4-yl}-benzoic acid methyl ester
Boc-L-NMe-Alanine-OH (1.0g, 4.92mmols) was dissolved in dioxan (10mls) and to this
- 20 was added pyridine (0.25mls), di-tert-butyl dicarbonate (1.4g, 6.4mmols) and ammonium hydrogen carbonate (0.49g, 6.2mmols). After stirring for 18 hours the crude reaction mixture was concentrated *in vacuo* and re-suspended in ethyl acetate. This was washed with 1M KHSO₄ and the organic layer dried over magnesium sulphate. After concentration, a clear oil was obtained (0.79g). This was dissolved in ethylene
- 25 glycol dimethyl ether (10mls) and to this was added Lawesson's reagent (4.31mmols, 1.74g). After stirring at room temperature for 3 hours the reaction mixture was concentrated *in vacuo* and the residue re-suspended in ethyl acetate. This was washed with 1M Na₂CO₃ and the organic layer dried over magnesium sulphate. After
- 30 concentration a yellow oil was obtained. This was purified by flash chromatography (heptane/ethyl acetate) to give a white solid (0.73g). This was dissolved in ethanol (10mls) and 4-(2-Bromo-acetyl)-benzoic acid methyl ester (3.34mmols, 0.86g) was added. The reaction was heated to 50°C for one hour. The crude product was purified by flash chromatography (heptane/ethyl acetate) to give a white solid (0.39g). ESMS (M + H = 377.23).

4-[2-(1-Dimethylamino-ethyl)-thiazol-4-yl]-benzoic acid

- 4-[2-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-4-yl]-benzoic acid methyl ester was deprotected with a solution of 4N HCl in dioxan for 1h. The solvent was removed in vacuo and the residue freeze dried to get a white solid which was methylated as followed. 4-[2-(1-Methylamino-ethyl)-thiazol-4-yl]-benzoic acid methyl ester (0.44 mmol) was stirred for one hour with formaldehyde (1.1 equivalent) in methanol (2ml) and sodium acetate buffer (1N, pH 5.5, 1 ml). Sodium cyanoborohydride (0.49 mmol) was added and the reaction stirred at RT for 2 h. The reaction was concentrated *in vacuo* and the residue was extracted in EtOAc and washed with a 1 M aqueous solution of sodium carbonate. The organic layer was concentrated *in vacuo* and the residue was hydrolysed by 6N aqueous HCl solution heated by microwave irradiation (200W) for 3 mins at 150 °C. The solution was freeze dried to give to 134 mg of hydrochloride salt of the title compound as a white powder $m/z = 277$ in MS ES+, which was characterised by HPLC and MS.

E-4-[2-(1H-Imidazol-4-yl)-vinyl]-benzoic acid (Example 8.28)

- {4-(methoxycarbonyl)benzyl(triphenyl)} phosphonium bromide on polymer support. Methyl-4-bromomethyl benzoate (26 mmol) were added to a suspension of 4.4 g of PS-Tripheiphosphine resin (Fluka, 3 mmol g^{-1}) in 40 ml of DMF. The solution was gently stirred at 65°C for 48 hours. The phosphonium resin was washed with DMF (4x40 ml), DCM (4x40 ml) and TBME (2x40 ml) and dried in vacuo for 18 h.

E-4-[2-(1H-Imidazol-4-yl)-vinyl]-benzoic acid

- A reaction tube containing a magnetic stirrer bar was charged with 1-Methyl-1H-imidazole-2-carbaldehyde(1.5mmol), potassium carbonate (2.1 mmol), {4-(methoxycarbonyl) benzyl(triphenyl)} phosphonium bromide on polymer support (1.5 mmol) and methanol (4 ml). The reaction tube was then sealed and heated by microwave irradiation (100W, 3 mins) to 150 °C and held at that temperature for 5 mins. The solution was filtered to remove the insoluble potassium carbonate and then concentrated *in vacuo*. The residue was purified by preparative HPLC and freeze dried to give E-4-[2-(1-Methyl-1H-imidazol-2-yl)-vinyl]-benzoic acid methyl ester as a white solid which was hydrolysed by 6N aqueous HCl solution heated by microwave

irradiation (200W) for 3 mins at 150 °C. The solution was freeze dried to give to 90 mg of hydrochloride salt of the title compound as a white powder $m/z = 215$ in MS ES+, which was characterised by HPLC and MS.

5 E-4-[2-(1-Methyl-1H-imidazol-2-yl)-vinyl]-benzoic acid (Example 8.29)

Same as example 8.28. 1-Methyl-1H-imidazole-2-carbaldehyde was used as the aldehyde. The title compound was obtained as a white powder $m/z = 229$ in MS ES+, which was characterised by HPLC and MS.

10 E-4-[2-(3-Methyl-3H-imidazol-4-yl)-vinyl]-benzoic acid (Example 8.30)

Same as example 8.28. 3-Methyl-3H-imidazole-4-carbaldehyde was used as the aldehyde. The title compound was obtained as a white powder $m/z = 229$ in MS ES+, which was characterised by HPLC and MS

15 4-[2-(1H-Imidazol-4-yl)-ethyl]-benzoic acid (Example 8.31)

E-4-[2-(1-Methyl-1H-imidazol-2-yl)-vinyl]-benzoic acid methyl ester was hydrogenated using Pd/C (10% of substrate weight), ammonium formate (5 equivalents) in isopropanol heated by microwave irradiation (200W) for 5 mins at 150 °C. The solution was filtered through celite to remove the insoluble catalyst, diluted with water and
20 freeze-dried to remove the excess of ammonium formate. The obtained solid was hydrolysed by 6N aqueous HCl solution heated by microwave irradiation (200W) for 3 mins at 150 °C. The solution was freeze dried to give to the hydrochloride salt of the title compound as a white powder $m/z = 217$ in MS ES+, which was characterised by HPLC and MS.

25

4-[2-(1-Methyl-1H-imidazol-2-yl)-ethyl]-benzoic acid (Example 8.32)

Same as example 8.31. 4-[2-(1-Methyl-1H-imidazol-2-yl)-vinyl]-benzoic acid methyl ester (Example 8.29) was used as the methyl ester. The title compound was obtained as a white powder $m/z = 231$ in MS ES+, which was characterised by HPLC and MS.

30

Potassium 4-methyl(pyridin-2-yl)aminomethylbenzoate (Example 8.33)

2-Methylaminopyridine (1.0 mmol) and methyl-4-formylbenzoate (1.0 mmol) were mixed in THF (2 mL) and dibutyltin dichloride (0.1 mmol) was added. After stirring at RT for 10 minutes, phenylsilane (1.1 mmol) was added and the reaction mixture allowed to stir at

room temperature for a further 17 h. The reaction mixture was then concentrated by N₂ stream and the residue purified by flash chromatography (silica gel, heptane:EtOAc) to give methyl 4-[methyl(pyridin-2-yl)amino]methylbenzoate : m/z = 257 in MS ES⁺ as a yellow oil which was used directly in the subsequent step.

- 5 To a solution of methyl ester (0.27 mmol) in 1,4-dioxane (0.6 mL) was added 1M aqueous KOH solution (0.59 mmol) and the reaction mixture stirred for 18 h. The reaction mixture was concentrated by N₂ stream, resuspended in water and the product lyophilised to give potassium 4-methyl(pyridin-2-yl)aminomethyl benzoate : m/z 243 in MS ES⁺ as an off-white solid which was used directly in the subsequent step.

10

Sodium 4-(2-{1(S)-[(tert-butoxycarbonyl)(methyl)amino]ethyl}-5-methyl-1,3-thiazol-4-yl)benzoate (Example 8.34)

- Ethyl 4-propionylbenzoate (2.0 mmol), pyrrolidinone hydrotribromide (2.1 mmol) and 2-pyrrolidinone (2.2 mmol) were heated in THF (20 mL) at 50°C for 2.5 h. The mixture was cooled, filtered, concentrated under vacuum and the residual oil partitioned between H₂O and MTBE. The aqueous layer was extracted with MTBE, and the combined organic layers were washed with saturated aqueous sodium metabisulfite solution, H₂O, brine, dried over MgSO₄ and the solvent removed under vacuum. The residue was purified by flash column chromatography (9:1 ¹Hexane : MTBE) to afford ethyl-4(2'-bromopropionyl)benzoate as a clear oil.

- 20 Ethyl 4(2'-bromopropionyl)benzoate (0.5 mmol), BOC(Me)Ala thioamide (0.5 mmol) and NMM (0.5 mmol) were heated in EtOH (2 mL) at 80°C for 3 h. The mixture was cooled, concentrated by N₂ stream and the crude product partitioned between H₂O and MTBE. The aqueous layer was extracted with MTBE, and the combined organic layers were washed twice with 1M KHSO₄, brine, dried over MgSO₄ and the solvent removed under vacuum to give a yellow oil. The residue was purified by flash column chromatography (9:1 ¹Hexane : EtOAc) to afford an intense yellow fraction. On standing for several hours, this fraction decolorises and ethyl 4-(2-{1(S)-[(tert-butoxycarbonyl)(methyl)amino]ethyl}-5-methyl-1,3-thiazol-4-yl)benzoate was isolated by flash column chromatography (9:1 ¹Hexane : EtOAc) as a clear oil : m/z = 405 (MH⁺) and 349 (M-BOC⁺) in MS ES⁺.

To a solution of ethyl ester (0.24 mmol) in 1,4-dioxane (5 mL) and water (1 mL) was added 1M NaOH (0.53 mL) and the reaction mixture stirred for 18 h. The reaction mixture was concentrated under vacuum, the product resuspended in water and

lyophilised to give sodium 4-(2-{1(S)-[(tert-butoxycarbonyl)(methyl)amino]ethyl}-5-methyl-1,3-thiazol-4-yl)benzoate

: m/z 377 (MH⁺) and 321 (M-BOC⁺) in MS ES⁺ as a white solid which was used directly in the subsequent step.

5

Lithium 4-{2-[1(S)-(dimethylamino)ethyl]-5-methyl-1,3-thiazol-4-yl}benzoate (Example 8.35)

Ethyl 4-(2-{1(S)-[(tert-butoxycarbonyl)(methyl)amino]ethyl}-5-methyl-1,3-thiazol-4-yl)benzoate was prepared as described previously.

10 To a solution of BOC-protected amine (0.25 mmol) in 1,4-dioxane (3 mL) was added 4M HCl in dioxane (4 mL) and the reaction mixture stirred for 2 h. The reaction mixture was concentrated under vacuum to afford a viscous pale yellow oil. The oil was dissolved in 1:1 H₂O:MeCN and lyophilised to afford ethyl 4-{2-[1(S)-(methylamino)ethyl]-5-methyl-1,3-thiazol-4-yl}benzoate hydrochloride salt.

15 A pH 5.5 buffer was prepared by adding AcOH to 1M NaOAc until pH 5.5 was reached. The amine hydrochloride (0.28 mmol) was dissolved in 1:1 buffer:MeOH (4 mL) and formaldehyde (37 weight % in water ; 0.31 mmol) was added. The mixture was stirred for 1 h and then sodium cyanoborohydride (0.31 mmol) was added portionwise. After 1 h, the reaction mixture was concentrated by N₂ stream. The residue was partitioned
20 between saturated aqueous NaHCO₃ and EtOAc. The aqueous layer was extracted with EtOAc and the combined organic layers were washed with H₂O, brine, dried over Na₂SO₄ and the solvent removed under vacuum. The residue was purified by preparative HPLC (0.1% TFA in H₂O : MeCN). The combined HPLC fractions were partitioned between saturated aqueous NaHCO₃ and EtOAc. The aqueous layer was
25 extracted with EtOAc and the combined organic layers were washed with brine, dried over Na₂SO₄ and the solvent removed under vacuum. The absence of EtOAc was confirmed by ¹H-NMR.

The ethyl ester (0.19 mmol) was dissolved in 1:1 H₂O:1,4-dioxane (8 mL) and 1M LiOH (0.42 mL) was added and the reaction mixture stirred for 17 h. The reaction mixture was
30 adjusted to pH 8 by addition of 1M HCl. The mixture was concentrated under vacuum, resuspended in 1:1 H₂O:MeCN and lyophilised to give lithium 4-(2-{1(S)-[(dimethylamino)ethyl]-5-methyl-1,3-thiazol-4-yl}benzoate : m/z 291 (MH⁺) in MS ES⁺ as a white solid and was used directly in the subsequent step.

5-(4-Methyl-morpholin-2-ylmethoxy)-benzofuran-2-carboxylic acid (Example 8.36)

Ethyl 5-methoxybenzofuran carboxylate (22.7 mmol) was dissolved in dichloromethane (20 ml) and a 1.0 M solution of boron tribromide methyl sulphide complex in dichloromethane (68.1 mmol) was added. The mixture was heated at reflux over night.

- 5 The solvent was evaporated *under vacuo* and the residue purified by flash chromatography to obtain ethyl 5-hydroxybenzofuran carboxylate as a white solid. Triphenyl phosphine polymer bound (8.96 mmol) was suspended in anhydrous dichloromethane (20 ml) then diisopropyl azodicarboxylate (7.76 mmol) was added and the mixture was stirred for 15 minutes at room temperature. Then ethyl 5-
- 10 hydroxybenzofuran carboxylate (5.97 mmol) was added over 5 minutes followed by the addition of 4-N-boc-3-morpholinecarboxylic acid (5.97 mmol) over 5 minutes too. The mixture was stirred at room temperature over night. The solvent was evaporated *under vacuo* and the residue purified by flash chromatography to obtain ethyl 5-(4-Boc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylate: $m/z = 406$ in MS ES+, as clear oil.
- 15 Ethyl 5-(4-Boc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylate (2.47 mmol) was dissolved in 30 ml of a 4.0 M solution of hydrochloric acid in dioxan and stirred at room temperature for 1 hour. After removing the solvent *under vacuo* the resulting amine was dissolved in anhydrous dichloromethane and N-methylmorpholine (5.67 mmol) was added and stirred at room temperature for 5 minutes. Then allylchloroformate (2.71
- 20 mmol) was added and the mixture was stirred at room temperature over night under an inert atmosphere. The mixture was washed with a 1.0 M solution of hydrochloric acid, water, dried over Na_2SO_4 and the solvent was evaporated *in vacuo*. The residue was purified by flash chromatography to yield ethyl 5-(4-alloc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylate: $m/z = 390$ in MS ES+, as a white solid.
- 25 Ethyl 5-(4-alloc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylate (2.09 mmol) was dissolved in 3 ml of tetrahydrofuran. Then 3 ml of a 1.0 M solution of lithium hydroxide were added and the mixture stirred at room temperature over night. After removing the tetrahydrofuran *under vacuo* the mixture was acidified with a 1 M solution of hydrochloric acid to Congo red, extracted with dichloromethane, washed with water,
- 30 dried over Na_2SO_4 and the solvent was removed *under vacuo* to yield 5-(4-alloc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylic acid as a white solid.
- 5-(4-Alloc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylic acid (3 equiv) was then incorporated on the peptide as described previously (600 mg; 0.32 mmol/g) with HBTU (3 equiv), HOBt (3 equiv) and NMM (6 equiv) in DMF over night at room temperature.

The Alloc group was removed with (1) DCM (4 x 1 min); (2) borane dimethylamine complex (40 equiv), tetrakis (triphenylphosphine) palladium (0) (0.1 equiv) in anhydrous DCM (2 x 15 min); (3) DCM (3 x 1 min); (4) DMF (3 x 1 min); (5) dioxan-water (9:1) (3 x 1 min); (6) DMF (3 x 1 min); (7) MeOH (3 x 1 min); (8) DCM (3 x 1 min) and the peptide resin was treated with dibutyltin dichloride (5 equiv), phenylsilane (5 equiv) and a 37% solution of formaldehyde in water (5 equiv) in THF for 2 hours at room temperature. The reminder of the procedure was carried out as described in the general protocol.

3-Methyl-5-(4-methyl-morpholin-2-ylmethoxy)-benzofuran-2-carboxylic acid

10 (Example 8.37)

4-Methoxyphenol (0.119 mol) was dissolved in dry toluene and treated with sodium hydride (0.120 mol) at room temperature for 60 h. The sodium phenolate solution was heated to +100 °C and α -chloroacetoacetate (0.09 mol) was added. After stirring at +110 °C for a further 4 hours, the mixture was cool to room temperature, washed with water and brine, dried over Na₂SO₄ and the solvent was evaporated *in vacuo* to yield a crude α -(4-methoxyphenoxy)acetoacetate as a dark brown oil. Phosphoric acid (0.22 mol) was mixed with P₂O₅ (0.35 mol) at room temperature and stirred at +130 °C for 4 hours. The mixture was allowed to cool to +100 °C, the acetoacetate was slowly added, and held at that temperature for 2 hours. After cooling to room temperature, ice was carefully added to the stirred solution, extracted with toluene, concentrated *in vacuo* and purified by flash chromatography on silica to yield ethyl 3-methyl-5-methoxybenzofuran carboxylate: m/z = 235 in MS ES⁺, as a white solid.

Ethyl 3-methyl-5-methoxybenzofuran carboxylate (8.53 mmol) was dissolved in dichloromethane (10 ml) and a 1.0 M solution of boron tribromide methyl sulphide complex in dichloromethane (25.59 mmol) was added. The mixture was heated at reflux over night. The solvent was evaporated *under vacuo* and the residue purified by flash chromatography to obtain ethyl 3-methyl-5-hydroxybenzofuran carboxylate as a white solid.

Triphenyl phosphine polymer bound (1.37 mmol) was suspended in anhydrous dichloromethane (10 ml) then diisopropyl azodicarboxylate (1.18 mmol) was added and the mixture was stirred for 15 minutes at room temperature. Then ethyl 3-methyl-5-hydroxybenzofuran carboxylate (0.91 mmol) was added over 5 minutes followed by the addition of 4-N-boc-3-morpholinecarboxylic acid (0.91 mmol) over 5 minutes too. The

mixture was stirred at room temperature over night. The solvent was evaporated *under vacuo* and the residue purified by flash chromatography to obtain ethyl 3-methyl-5-(4-Boc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylate: $m/z = 419$ in MS ES+, as clear oil.

- 5 Ethyl 3-methyl-5-(4-Boc-morpholin-2-ylmethoxy)-benzofuran-2-carboxylate (1.05 mmol) was dissolved in 30 ml of a 4.0 M solution of hydrochloric acid in dioxan and stirred at room temperature for 1 hour. After removing the solvent *under vacuo* the resulting amine was dissolved in 20 ml of a mixture 2 to 1 of methanol and a buffered solution of acetic acid and sodium acetate at pH=5.3. A 37% solution of formaldehyde in water
10 (1.16 mmol) was added and the mixture was stirred at room temperature for 1 hour. Then sodium cyanoborohydride (1.16 mmol) was added and the mixture was stirred over night at room temperature. The methanol was removed *under vacuo* and the water was eliminated by liophylisation. The solid obtained was purified by flash chromatography to yield ethyl 3-methyl-5-(4-methyl-morpholin-2-ylmethoxy)-
15 benzofuran-2-carboxylate: $m/z = 334$ in MS ES+, as a white solid. Ethyl 3-methyl-5-(4-methyl-morpholin-2-ylmethoxy)-benzofuran-2-carboxylate (0.12 mmol) was dissolved in 300 μ l of tetrahydrofuran. Then 300 μ l of a 1.0 M solution of lithium hydroxide were added and the mixture stirred at room temperature for 3 hours. The tetrahydrofuran was removed *under vacuo* and the water eliminated by
20 lyophilisation to yield the tilted compound as a white solid: $m/z = 304$ in MS ES-.

4-[2-(1-Dimethylamino-ethyl)-thiazol-5-yl]-benzoic acid lithium salt (Example 8.38)

4-(2-Azido-acetyl)-benzoic acid methyl ester .

- 25 4-(2-Bromo-acetyl)-benzoic acid methyl ester (15.5mmol) was dissolved in ethanol (120ml) and acetic acid (4.8ml). Sodium azide (31mmol) was added and the reaction stirred at 4°C overnight. The ethanol was removed and the mixture diluted with ethyl acetate (100ml). The organic layer was washed with saturated sodium hydrogen carbonate (2x50ml) and dried (MgSO_4). The solvent was removed *in vacuo* to give a yellow solid, which was re-crystallized from ethanol to give the title compound as a pale
30 yellow solid (2.6g). IR 2117cm^{-1}

4-(2-Amino-acetyl)-benzoic acid methyl ester hydrochloride .

4-(2-Azido-acetyl)-benzoic acid methyl ester (6.53 mmol) was suspended in methanol (30ml) and aqueous hydrochloric acid (6.53 mmol, 1M) was added. A catalytic amount of palladium on carbon (10% wt) was added and the reaction stirred over an

atmosphere of hydrogen for 3h. The reaction was filtered and the solvent removed *in vacuo* to give the title compound (1.3g) as a yellow solid $m/z = 194$ in MS ES+, which was used in the next step without purification.

5 4-{2-[2-(S)-(tert-Butoxycarbonyl-methyl-amino)-propionylamino]-acetyl}-benzoic acid methyl ester .

4-(2-Amino-acetyl)-benzoic acid methyl ester hydrochloride (2.22mmol), WSC.HCl (2.44mmol), Boc-N-methyl-(L)-alanine (2.44mmol) and HOBt (2.77mmol) were suspended in dichloromethane (10ml). NMM (2.44mmol) was added and the reaction
10 stirred for 2h. The reaction was diluted with ethyl acetate (50ml) and washed with 10% citric acid (2x25ml) and saturated sodium hydrogen carbonate (2x25ml). The organic layer was dried ($MgSO_4$) and the solvent removed *in vacuo* to give a brown oil residue. Purification by silica chromatography eluting with 10-50% ethyl acetate/ iso-hexane gave the title compound (620mg) as a pale yellow oil $m/z = 379$ in MS ES+.

15

4-{2-(S)-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-5-yl}-benzoic acid methyl ester .

4-{2-[2-(S)-(tert-Butoxycarbonyl-methyl-amino)-propionylamino]-acetyl}-benzoic acid methyl ester (1.65mmol) was dissolved in dry THF and Lawesson's reagent (2.5mmol)
20 was added. The reaction was heated at reflux for 5h and cooled to room temperature. The solvent was removed *in vacuo* and the residue was dissolved in ethyl acetate (100ml). The organic layer was washed with 10% citric acid (2x50ml) and saturated sodium hydrogen carbonate (2x50ml) and dried ($MgSO_4$). The solvent was removed *in vacuo* to give a yellow oil residue, which was purified by silica chromatography to give
25 the title compound (570mg) as a pale yellow solid. 1H NMR ($CDCl_3$, 400MHz) 1.5(s, 9H), 1.6(d, 7Hz), 2.8 (brs, 3H), 3.9(s, 3H), 5.6(brm, 1H), 7.6(m, 2H), 7.9(s, 1H), 8.0(m, 2H).

4-{2-(S)-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-5-yl}-benzoic acid .

4-{2-(S)-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-5-yl}-benzoic acid methyl
30 ester (0.75mmol) was dissolved in methanol (10ml) and lithium hydroxide (10ml, 1M) was added. The reaction was stirred at room temperature overnight and the methanol removed *in vacuo*. The aqueous solution was taken to pH=3 with 1M hydrochloric acid and extracted with ethyl acetate (2x50ml). The organic layer was dried ($MgSO_4$) and the solvent removed *in vacuo* to give an off-white powder, which was purified by silica

chromatography eluting with 50-80% ethyl acetate/ iso-hexane. The title compound was obtained as a white powder (252mg) $m/z = 363$ in MS ES+.

4-[2-(S)-(1-Dimethylamino-ethyl)-thiazol-5-yl]-benzoic acid methyl ester .

- 5 4-{2-(S)-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-5-yl}-benzoic acid (0.75mmol) was dissolved in 50% TFA/ DCM (2ml) and stirred for 1h. The solvent was removed *in vacuo* and the residue placed under high vacuum for 3h to give a light brown oil residue. The residue was dissolved in methanol (2ml) and buffer (1ml, 1M sodium acetate/ acetic acid, pH=5.5) was added. Formaldehyde (0.83mmol, 37wt% in
- 10 water) was added and the reaction stirred for 30 minutes. Sodium cyanoborohydride (0.83mmol) was added and the reaction stirred overnight at room temperature. The methanol was removed *in vacuo* and the aqueous diluted with saturated sodium hydrogen carbonate (25ml). The aqueous layer was extracted with ethyl acetate (2x25ml) and the organic layer dried (MgSO₄). The solvent was removed *in vacuo* and
- 15 the residue purified by silica chromatography to give the title compound (158mg) as an off-white solid ¹H NMR (CD₃OD, 400MHz) 1.5(d, J 7Hz), 2.3(s, 6H), 3.9(s, 3H), 3.95(q, J 7Hz), 7.7(m, 2H), 8.0(m, 3H).

4-[2-(1-Dimethylamino-ethyl)-thiazol-5-yl]-benzoic acid lithium salt .

- 20 4-{2-(S)-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-5-yl}-benzoic acid (0.54mmol) was dissolved in methanol (2ml) and lithium hydroxide (0.54mmol, 1M) was added. The reaction was stirred overnight and the methanol removed *in vacuo*. The residue was diluted with water (5ml) and the aqueous layer extracted with ethyl acetate. The aqueous layer was freeze-dried to give the title compound as an off-white solid
- 25 (143mg) which was used in the next step without further purification $m/z = 277$ in MS ES+.

5-N,N-Dimethylamino-1H-indole-2-carboxylic acid (Example 8.39)

5-Amino-1H-indole-2-carboxylic acid ethyl ester .

- 30 5-Nitro-1H-indole-2-carboxylic acid ethyl ester (14.9 mmol) was suspended in acetone (50 ml) and added to a mixture of titanium(III) chloride (91ml, >10% in 2M hydrochloric acid) and ammonium acetate (265ml, 4M). The reaction was stirred for 2h and neutralized with saturated sodium hydrogen carbonate. The mixture was extracted with ethyl acetate (100ml) and the organic layer dried (MgSO₄). The solvent was removed *in*

vacuo to give a light brown solid which was purified by silica chromatography to give the title compound as an off-white solid (1.57g) $m/z = 205$ in MS ES+.

5-N,N-Dimethylamino-1H-indole-2-carboxylic acid ethyl ester .

- 5 5-Amino-1H-indole-2-carboxylic acid ethyl ester (7.7mmol) was dissolved in acetonitrile (30ml) and formaldehyde (19.2mmol, 37%wt in water) was added. Sodium cyanoborohydride (7.7mmol) was added and the reaction stirred at room temperature overnight. The acetonitrile was removed *in vacuo* and the residue was purified by silica chromatography to give the title compound was a pale yellow solid (244mg). $m/z = 233$
10 in MS ES+.

5-N,N-Dimethylamino-1H-indole-2-carboxylic acid

- 5-N,N-Dimethylamino-1H-indole-2-carboxylic acid ethyl ester (1.05mmol) was suspended in ethanol (1ml) and lithium hydroxide (1.2ml, 1M in water) was added. The
15 reaction was stirred at room temperature overnight. The solution was taken to pH=7 with 1M hydrochloric acid and the ethanol removed *in vacuo*. The aqueous layer was extracted with ethyl acetate and the organic layer dried (MgSO₄). The ethyl acetate was removed *in vacuo* to give the title compound as a yellow powder (75mg), which was used in the next step without purification. $m/z = 205$ in MS ES+.

20

4-{2-[1-(tert-Butoxycarbonyl-methyl-amino)-ethyl]-thiazol-4-yl}-benzoic acid (Example 8.40)

- Boc-L-NMe-Alanine-OH (1.0g, 4.92mmols) was dissolved in dioxan (10mls) and to this was added pyridine (0.25mls), di-tert-butyl dicarbonate (1.4g, 6.4mmols) and
25 ammonium hydrogen carbonate (0.49g, 6.2mmols). After stirring for 18 hours the crude reaction mixture was concentrated *in vacuo* and re-suspended in ethyl acetate. This was washed with 1M KHSO₄ and the organic layer dried over magnesium sulphate. After concentration a clear oil was obtained (0.79g). This was dissolved in ethylene glycol dimethyl ether (10mls) and to this was added Lawesson's reagent (4.31mmols,
30 1.74g). After stirring at room temperature for 3 hours the reaction mixture was concentrated *in vacuo* and the residue re-suspended in ethyl acetate. This was washed with 1M Na₂CO₃ and the organic layer dried over magnesium sulphate. After concentration a yellow oil was obtained. This was purified by flash chromatography (heptane/ethyl acetate) to give a white solid (0.73g). This was dissolved in ethanol

(10mls) and 4-(2-Bromo-acetyl)-benzoic acid methyl ester (3.34mmols, 0.86g) was added. The reaction was heated to 50°C for one hour. The crude product was purified by flash chromatography (heptane/ethyl acetate) to give a white solid (0.39g). ESMS ($M + H = 377.23$) which was subsequently hydrolysed to the corresponding acid.

4-[2-(1-Dimethylamino-2-methoxy-ethyl)-thiazol-4-yl]-benzoic acid (Example 8.41)

Boc-L-Serine(OMe)-OH (2.4g, 6.0mmols) was dissolved in dioxan (20mls) and to this was added pyridine (0.31mls), di-tert-butyl dicarbonate (1.7g, 7.8mmols) and ammonium hydrogen carbonate (0.62g, 7.2mmols). After stirring for 18 hours the crude reaction mixture was concentrated *in vacuo* and re-suspended in ethyl acetate. This was washed with 1M KHSO_4 and the organic layer dried over magnesium sulphate. After concentration the crude product was purified by flash chromatography to yield 0.55g of a clear oil. This was dissolved in ethylene glycol dimethyl ether (20mls) and to this was added Lawesson's reagent (2.78mmols). After stirring at room temperature for 3 hours the reaction mixture was concentrated *in vacuo* and the residue purified by flash chromatography (silica gel, DCM) to give a yellow oil (2-Methoxy-1-thiocarbamoyl-ethyl)-carbamic acid tert-butyl ester (0.49g).

The ester (0.25g, 1.07mmols) was dissolved in ethanol (10mls) and 4-(2-Bromo-acetyl)-benzoic acid methyl ester (1.18mmols, 0.30g) was added. The reaction was heated to 50°C for one hour. The crude product was purified by preparative HPLC ($\text{MeCN}/\text{H}_2\text{O}$) to yield 0.138g of a yellow solid. The Boc group was removed via treatment with 4M HCl /dioxan for one hour after which time the reaction mixture was concentrated *in vacuo*. The free amine (0.093g, 0.265mmols) was then dimethylated. The crude HCl salt was dissolved in 5mls of methanol and buffered with 2.5mls pH 5.5 Sodium acetate/acetic acid. Formaldehyde was added (0.58mmols) and the reaction stirred for one hour. Sodium cyanoborohydride was then added (0.58mmols, 0.036g) and the reaction stirred for a further thirty minutes. The reaction mixture was concentrated *in vacuo* and purified by preparative HPLC to yield 60mg of a yellow solid. Finally, the methyl ester was hydrolysed with 1M LiOH (5mls) and dioxan (5mls) at room temperature for two hours. The reaction mixture was concentrated *in vacuo* and lyophilised from water to yield 62mg of the desired acid as the lithium salt. ESMS ($M + H = 307.04$)

4-[2-(4-Fluoro-1-methyl-pyrrolidin-2-yl)-thiazol-4-yl]-benzoic acid (Example 8.42)

4-Fluoro-2-[4-(4-methoxycarbonyl-phenyl)-thiazol-2-yl]-pyrrolidine-1-carboxylic acid tert-butyl ester (0.1g) was treated with 4M HCl/dioxan (10mls) for 2 hours. The reaction mixture was then concentrated *in vacuo* and lyophilised from water to yield a yellow solid (0.8g). The crude HCl salt was dissolved in 5mls of methanol and buffered with 2.5mls pH 5.5 Sodium acetate/acetic acid. Formaldehyde was added (0.38mmols, 0.0032mls) and the reaction stirred for one hour. Sodium cyanoborohydride was then added (0.38mmols, 0.024g) and the reaction stirred for a further thirty minutes. The reaction mixture was concentrated *in vacuo* and the residue re-suspended in ethyl acetate. This was washed with 1M Na₂CO₃ and the organic layer dried over magnesium sulphate. After concentration a yellow solid was obtained (0.075g). Finally, the methyl ester was hydrolysed with 1M LiOH (5mls) and dioxan (5mls) at room temperature for two hours. The reaction mixture was concentrated *in vacuo* and lyophilised from water to yield 62mg of the desired acid as the lithium salt. ESMS (M + H = 306.88)

2-[4-(4-Carboxy-phenyl)-thiazol-2-yl]-4-fluoro-pyrrolidine-1-carboxylic acid (Example 8.43)

2-[4-(4-Carboxy-phenyl)-thiazol-2-yl]-4-fluoro-pyrrolidine-1-carboxylic acid tert-butyl ester The amide (0.32g, 1.37mmols) was dissolved in ethylene glycol dimethyl ether (10mls) and to this was added Lawesson's reagent (0.61g, 1.5mmols). After stirring at room temperature for 3 hours the reaction mixture was concentrated *in vacuo* and the residue re-suspended in ethyl acetate. This was washed with 1M Na₂CO₃ and the organic layer dried over magnesium sulphate. After concentration a yellow oil was obtained. This was purified by flash chromatography (heptane/ethyl acetate) to give a white solid (0.36g). This was dissolved in ethanol (10mls) and 4-(2-Bromo-acetyl)-benzoic acid methyl ester (0.41g, 1.59mmols) was added. The reaction was heated to 50°C for one hour. The crude product was purified by flash chromatography (heptane/ethyl acetate) to give a white solid (0.34g). The methyl ester was then treated with 1M LiOH (10mls) and dioxan (10mls) for 3 hours. After quantitative hydrolysis, the crude product was concentrated *in vacuo* and the residue re-suspended in ethyl acetate. This was washed with 1M KHSO₄ and the organic layer dried over magnesium sulphate. After concentration *in vacuo* the product was lyophilised from acetonitrile/water to yield the title compound as a white solid (0.32g). ESMS (M + H = 393.03).

Lithium 5-(4-N-methylmorpholino-2S-methyloxy)benzofuran carboxylate (Example 8.36 as single enantiomers)

Ethyl 5-(4-boc-morpholino-2R-methyloxy)benzofuran carboxylate.

- 5 4-Boc-2R-hydroxymethylmorpholine was prepared according to method described in *Heterocycles*, 1993 35, 105-109. To a mixture of polymer supported triphenylphosphine (2.4 mmol) and the hydroxymethylmorpholine (1.2 mmol) in dry dichloromethane (5 ml) ethyl-5-hydroxybenzofuran-2-carboxylate (1.2 mmol) and DIAD (1.2 mmol) was added at room temperature. The mixture was stirred further 16 hours, filtrated, diluted in
10 dry dichloromethane (5 ml) and stirred at room temperature another 16 hours. Filtrated, concentrated *in vacuo* and purified by y flash chromatography on silica (ethylacetate, hexane) to yield ethyl-5-(4-boc-morpholino-2R-methyloxy)benzofuran carboxylate (0.3 mmol), $m/z = 406$ in MS ES+, as an oil.

- 15 Lithium 5-(4-N-methylmorpholino-2R-methyloxy)benzofuran carboxylate. Ethyl-5-(4-boc-morpholino-2R-methyloxy)benzofuran carboxylate (0.3 mmol) was dissolved in HCl in dioxane (4M, 15 ml), stirred at room temperature for 4 hours, concentrated *in vacuo* to a pale yellow oil. The crude benzofuran hydrochloride (0.3 mmol) and formaldehyde (0.35 mmol) were mixed in THF (5 mL) and dibutyltin
20 dichloride (0.05 mmol) was added. After stirring at RT for 5 minutes, phenylsilane (0.6 mmol) was added and the reaction allowed to stir at room temperature for a further 17 h. The reaction was then concentrated *in vacuo* and the residue purified by flash chromatography (silica gel, ethyl acetate, isopropanol, triethylamine) to give ethyl-5-(4-N-methylmorpholino-2R-methyloxy)benzofuran carboxylate: $m/z = 320$ in MS ES+ as a
25 clear oil.

To ethyl-5-(4-N-methylmorpholino-2R-methyloxy)benzofuran carboxylate (0.6 mmol) in 5 ml dioxane was added LiOH (0.6 mmol) in 1 ml of water. The mixture was refluxed for 16 hours, concentrated *in vacuo* to give lithium 5-(4-N-methylmorpholino-2R-methyloxy)benzofuran carboxylate: $m/z 292$ in MS ES+ as a white solid.

30

Lithium 5-(4-N-methylmorpholino-2S-methyloxy)benzofuran carboxylate.

S-isomer: $m/z 292$ in MS ES+ was prepared as a white solid white solid according to method used to prepare R-isomer but substituting 4-Boc-2R-hydroxymethylmorpholine by 4-Boc-2S-hydroxymethylmorpholine.

4-(3-Methyl-5-morpholino-4-ylmethyl-thiophen-2-yl)-benzoic acid (Example 8.44)

5-Bromo-4-methyl-thiophene-2-carboxylic acid methyl ester (8.51 mmol) was dissolved in EtOH (100ml) and NaOH (42.5 mmol) added, as a 1M solution in water. Reaction

5 was heated to 80°C for 2h, after which time all starting material had been consumed. Reaction was then concentrated *in vacuo* and the residue taken up in DCM and shaken with 1M HCl. The resulting biphasic mixture was then filtered and the filtrant washed with hexane and dried under vacuum. This gave 5-Bromo-4-methyl-thiophene-2-carboxylic acid as off white solid : m/z in MS AP- = 219, 221 [M-H]⁻, 6.79 mmol, 80%.

10 5-Bromo-4-methyl-thiophene-2-carboxylic acid (6.79 mmol) was taken up in 30ml DMF and morpholine (7.47 mmol), WSC.HCl (7.47 mmol) and HOBt (7.47 mmol) were added. Reaction was stirred at room temperature for 17h and then diluted with EtOAc, washed with 1M HCl and brine, dried over Na₂SO₄ and concentrated *in vacuo*. Flash chromatography of the residue (silica, 33-50% EtOAc in hexane) gave (5-Bromo-4-methyl-thiophen-2-yl)-morpholin-4-yl-methanone as a pale golden oil : m/z in MS ES+ = 290, 292 [M+H]⁺, 4.67mmol, 69%.

(5-Bromo-4-methyl-thiophen-2-yl)-morpholin-4-yl-methanone (1.78 mmol) was added to a flask containing 1M THF.BH₃ complex in THF (4.45mmol). Reaction was stirred at reflux for 2.5h under N₂. Methanol was then added until gas evolution ceased, followed

20 by 10ml of 1M NaOH and the reaction stirred at reflux for a further 7h. The mixture was cooled to room temperature and extracted with EtOAc. This extract was concentrated *in vacuo* and the residue taken up in 1M HCl and washed with EtOAc. The acid layer was then basified with 1M NaOH and extracted back into EtOAc. Removal of solvent gave 4-(5-Bromo-4-methyl-thiophen-2-ylmethyl)-morpholine as a colourless oil : m/z in MS ES+ = 276, 278 [M+H]⁺, 0.98 mmol, 55%.

25 4-(5-Bromo-4-methyl-thiophen-2-ylmethyl)-morpholine (0.98mmol) was taken up in 10ml toluene and 4-carboxymethylphenylboronic acid (0.98mmol) was added as a solution in 1ml of EtOH. 6ml of 2M aqueous Na₂CO₃ solution was added, followed by Pd(PPh₃)₄ (0.098mmol). Reaction was stirred at 70°C for 17h under a nitrogen atmosphere and

30 then cooled to room temperature and extracted with DCM (x2). Combined organic layers were washed with brine, concentrated *in vacuo* and the residue purified by flash chromatography (silica, 33-99% EtOAc in hexane). This furnished the pure 4-(3-Methyl-

5-morpholin-4-ylmethyl-thiophen-2-yl)-benzoic acid methyl ester as a waxy white solid :
m/z in MS ES⁺ = 332 [M+H]⁺, 0.090mmol, 9%.

This ester (0.09mmol) was heated to 70°C in 18% HCl for 2h at which point HPLC
5 showed all the starting material to have been hydrolysed. The reaction was cooled and
the product that precipitated out of solution was collected by filtration as a white solid.
With no further purification this was coupled using the standard procedure.

3-Methyl-4-(5-morpholin-4-ylmethyl-furan-2-yl)-benzoic acid (Example 8.45)

10 A three necked flask was charged with methyl 4-bromo-3-methylbenzoate (2.18mmol),
bis(pinacolato)diboron (2.29mmol), palladium acetate (0.065mmol), potassium acetate
(6.54mmol) and DMF (10ml). The solution was degassed by bubbling through N₂ gas
for 30mins and was then heated to 80°C under N₂ for 3h. Reaction was then cooled to
room temperature and 4-(5-Bromo-furan-2-ylmethyl)-morpholine (2.18mmol), cesium
15 carbonate (3.27mmol) and Pd(PPh₃)₄ (0.065mmol) added. The reaction was heated to
80°C and stirred for a further 17h. Mixture was then diluted with EtOAc and water and
filtered through a celite pad to remove black particulates. The organic layer was
separated, washed with brine and dried over Na₂SO₄ and concentrated in vacuo. Flash
chromatography of the residue (silica, 10-99% EtOAc in hexane) gave 3-Methyl-4-(5-
20 morpholin-4-ylmethyl-furan-2-yl)-benzoic acid methyl ester as a grey powdery solid: m/z
in MS ES⁺ = 316 [M+H]⁺, 0.51mmol, 23%.

This ester (0.51mmol) was heated to 70°C in 18% HCl for 2h at which point HPLC
showed all the starting material to have been hydrolysed. The reaction was cooled and
the product that precipitated out of solution was collected by filtration as a white solid.

25 With no further purification this was coupled using the standard procedure.

4-[5-Methyl-2-(4-methyl-piperazin-1-yl)-thiazol-4-yl]-benzoic acid (Example 8.46)

4-propionylbenzoic acid (890 mg, 5 mmol), NaHCO₃ (1.26 g, 15 mmol), and
iodomethane (935 µL, 15 mmol) in DMF (10 mL) were stirred at RT overnight. The
30 mixture was diluted with saturated aqueous NaCl (50 mL) and extracted with ether (3 x
50 mL). The organic phase was washed with water (50 mL), dried, and evaporated.
Flash chromatography (90 g silica, 2/1 petroleum ether – EtOAc) gave white solids of 4-
Propionyl-benzoic acid methyl ester (744 mg, 77%).

¹H NMR (CDCl₃, 400MHz) δ 1.24 (t, 3H, J = 7 Hz), 3.03 (q, 2H, J = 7 Hz), 3.95 (s, 3H), 8.0 and 8.12 (ABq, 4H)

- 5 4-Propionyl-benzoic acid methyl ester (744 mg, 3.87 mmol), pyrrolidone hydrotribromide (1.98 g), and 2-pyrrolidinone (380 mg, 4.5 mmol) in THF (38 mL) were heated at 50 °C under nitrogen for 3 h. The mixture was cooled, filtered, concentrated, and then redissolved in ether (50 mL). The ether solution was washed successively with
10 NaCl (20 mL), and water (20mL), dried and evaporated to give crude 4-(2-Bromo-propionyl)-benzoic acid methyl ester as a yellow oil (1.025 g) that was used directly in the Hantzsch coupling. This material contained 91% of the desired bromoketone, 5% starting material, and 4% 4-bromo-1-butanol, as determined by ¹H NMR.

- 15 ¹H NMR (CDCl₃, 400MHz) δ 1.92 (d, 3H, J = 7 Hz), 3.96 (s, 3H), 5.28 (q, 1H, J = 7 Hz), 8.07 and 8.14 (ABq, 4H)

- All of the 4-(2-Bromo-propionyl)-benzoic acid methyl ester above and piperazine-1-carboxylic acid *tert*-butyl ester (*J. Med. Chem.*, 1998, 5037-5054, 917 mg, 3.73 mmol)
20 were refluxed in 36 mL THF at 70 °C for 2 h, under N₂. The precipitate was filtered and the filtrate evaporated to give yellow solids. Flash column chromatography (silica, 5/1 petroleum ether – EtOAc) gave 624 mg of 4-[4-(4-Methoxycarbonyl-phenyl)-5-methyl-thiazol-2-yl]-piperazine-1-carboxylic acid *tert*-butyl ester as a light yellow solid. Chromatography of the precipitate
25 (silica, 2/1 petroleum ether – EtOAc) gave 32 mg more of compound. Total yield is 44%.

¹H NMR (CDCl₃, 400MHz) δ 1.46 (s, 9H), 2.43 (s, 3H), 3.42, (m, 4H), 3.54 (m, 4H), 3.90 (s, 3H), 7.68 and 8.04 (ABq, 4H).

- 30 The above methyl ester (564 mg, 1.35 mmol) was heated with 1.35 mL 2N NaOH, 5 mL THF, and 3.65 mL water at 60 °C for 4 h. The reaction mixture was evaporated, poured into 20 mL saturated aqueous NaCl and 20 mL CH₂Cl₂, and then acidified to pH 3 with 5% citric acid, in an ice bath. The layers were separated and the organic phase was

extracted further with 2 x 10 mL CH₂Cl₂. The organic phases were combined, washed with water (10 mL), dried, and evaporated to give 4-[4-(4-Carboxy-phenyl)-5-methyl-thiazol-2-yl]-piperazine-1-carboxylic acid tert-butyl ester as a light yellow solid (537 mg, 98%).

5

¹H NMR (CDCl₃, 400MHz) δ 1.48 (s, 9H), 2.47 (s, 3H), 3.47 (m, 4H), 3.57 (m, 4H), 7.74 and 8.12 (ABq, 4H).

¹³C NMR (CDCl₃, 100MHz) δ ppm: 12.6, 28.3, 42.8, 48.1, 80.3, 119.1, 127.8, 128.2, 130.1, 140.5, 145.6, 154.6, 167.2, 171.4.

10 LCMS: (M + H)⁺ 404, (M – H)⁻ 402.

4-[4-(4-Carboxy-phenyl)-5-methyl-thiazol-2-yl]-piperazine-1-carboxylic acid tert-butyl ester (0.421 mmol) was dissolved in 4M HCl in 1,4-dioxane, and stirred at room temperature for 1 h. The solvent was then removed under vacuum, and the residue 4-(5-Methyl-2-piperazin-1-yl-thiazol-4-yl)-benzoic acid was suspended in 15 methanol (10 ml) and treated with AcOH/AcONa buffer (pH ~5.5, 5 ml), and formaldehyde (0.547 mmol). The reaction mixture was stirred at room temperature for 1 h, then treated with NaCNBH₃ (0.547 mmol) and stirred at room temperature overnight. The solvent was then removed under vacuum, and the residue was purified by column 20 chromatography to afford the title compound (0.403 mmol, 95%). MS(ES) m/z 318 (100%, [M+H]⁺).

4-(2-Morpholin-4-yl-thiazol-4-yl)-benzoic acid (Example 8.47)

4-(2-bromoacetyl)benzoic acid (1.23 mmol) and 1-morpholinethiocarboxamide (1.23 25 mmol, J. Med. Chem 1998, 41, 5037-5054) were mixed in THF (10 mL), then refluxed for 3.5 h. The reaction mixture was then allowed to reach room temperature and the obtained precipitate was collected by filtration and washed with 4 portions of diethyl ether. The crude product was crystallized from hot 1:1 EtOH-EtOAc to give a first 30 harvest of colorless needles (0.16 g, 0.55 mmol). ¹H NMR (DMSO-d₆, 400 MHz) δ 7.94 (4H, m), 7.49 (1H, s), 3.72 (4H, m), 3.44 (4H, m).

4-(2-Piperidin-1-yl-thiazol-4-yl)-benzoic acid (Example 8.48)

4-(2-bromoacetyl)benzoic acid (1.23 mmol) and 1-piperidinethiocarboxamide (1.23 mmol) were mixed in THF (10 mL), then refluxed for 3 h. The reaction mixture was then allowed to reach room temperature and the obtained precipitate was collected by
5 filtration and washed with 3 portions of diethyl ether. The crude product was crystallized from hot 1:1 EtOH-EtOAc to give a first harvest of colorless needles (0.28 g, 0.95 mmol). ¹H NMR (DMSO-d₆, 400 MHz,) δ 7.93 (4H, m), 7.40 (1H, s), 3.48 (4H, m), 1.60 (6H, m).

4-(2-Dimethylamino-thiazol-4-yl)-benzoic acid (Example 8.49)

To a stirred mixture of thiocarbonyldiimidazole (44.9 mmol) in THF (40 mL) at room temperature was added portionwise 2 M Dimethylamine in THF (44 mmol) and a temperature increase was observed. 40 min after final addition the reaction mixture was heated to 55 °C for 1 h, then allowed to reach room temperature again. The reaction
15 was then concentrated *in vacuo* and the residue purified by flash chromatography (silica gel, Petroleum ether-EtOAc) to give the intermediate Imidazole-1-carbothioic acid dimethylamide. This material was treated with freshly prepared sat. ammonia in methanol (40 ml) for 60 h, then concentrated *in vacuo* and the precipitated residue was suspended in diethyl ether and collected by filtration. The precipitate was washed with
20 diethyl ether and air-dried to give a slight yellow solid (1.71 g, 16.4 mmol) which was used in the subsequent step. 4-(2-bromoacetyl)benzoic acid (1.23 mmol) and 1-piperidinethiocarboxamide (1.23 mmol) were mixed in THF (10 mL), then refluxed for 3 h. The reaction mixture was then allowed to reach room temperature and the obtained precipitate was collected by filtration and washed with 3 portions of diethyl ether. The
25 crude product was crystallized from hot 1:1 EtOH-EtOAc to give a first harvest of colorless needles (0.1 g, 0.40 mmol). ¹H NMR (DMSO-d₆, 400 MHz) δ 7.94 (4H, m), 7.37 (1H, s), 3.11 (6H, m).

4-[2-(Isopropyl-methyl-amino)-5-methyl-thiazol-4-yl]-benzoic acid (Example 8.50)

30 To a solution of 4-propionylbenzoic acid (11.2 mmol), benzyl alcohol (1.1 mL, 10.7 mmol) and dimethylaminopyridine (0.14 g, 1.1 mmol) in dichloromethane (90 ml) at 0 °C was added N-Ethyl-N'-(3-dimethylaminopropyl)carbodiimide x HCl (2.4 g, 12.3 mmol), then stirred at room temperature overnight. The obtained solution was then diluted with

DCM, washed successively with aq. 10% citric acid and aq. sat. sodium hydrogen carbonate, then dried (Na_2SO_4), filtered and concentrated *in vacuo*. Flash chromatography of the residue (silica gel, Petroleum ether-EtOAc) gave a colorless oil which crystallized upon standing (2.67 g). A portion of the benzyl ester from above (1 g, 3.73 mmol) was refluxed with 2-pyrrolidinone (0.37 g, 4.33 mmol) and pyrrolidone hydrotribromide (1.85 g, 3.73 mmol) in THF for 1.5 h. The resulting reaction mixture was allowed to reach room temperature, then diluted with EtOAc, washed successively with water, aq. 10% sodium thiosulphate, aq. sat. sodium hydrogen carbonate and brine, then dried (Na_2SO_4), filtered and concentrated *in vacuo*. The obtained bromide from above was directly mixed with isopropylthiocarboxamide (0.44 g, 3.73 mmol) in THF (20 mL) and refluxed overnight, then concentrated onto silica. Flash chromatography of the residue (silica gel, Petroleum ether-EtOAc- Et_3N) gave a light red oil (1.28g, 3.49 mmol). To a stirred solution of the thiazole derivative (0.250 g, 0.68 mmol), obtained above, in acetonitrile (7 mL), acetic acid (1.3 mL) and aq. 37% formaldehyde (2 mL) at 0 °C was added sodium cyanoborohydride (0.09 g), then stirred at room temperature overnight. Additional sodium cyanoborohydride (0.08 g) was added, and after stirring for additional 2 h, the reaction mixture was diluted with water, neutralized using aq. 0.5 M sodium carbonate, then extracted with dichloromethane. The dichloromethane layers were collected, dried (Na_2SO_4), filtered and concentrated. Flash chromatography (silica gel, Petroleum ether-EtOAc) of the residue gave a slight yellow crystalline solid (0.115 g). ^1H NMR (CDCl_3 , 400 MHz,) δ 8.09 (2H, d), 7.72 (2H, d), 7.27-7.32 (5H, m), 5.38 (2H, s), 4.27 (1H, m), 2.92 (3H, s), 2.42 (3H, s), 1.22 (6H, d). The benzyl ester from above (0.25 g, 0.66 mmol) was hydrolysed by treating with aq. 1M LiOH (1.3 mL) in THF (2 mL) at 60 °C overnight. The obtained solution was then made slight acidic with aq. 10% citric acid and then extracted using dichloromethane. The organic layer was then dried (Na_2SO_4), filtered and concentrated. Column chromatography of the residue (Silica gel, dichloromethane-methanol) gave the title compound as a crystalline solid (0.19 g) m/z = 304 in MS ES^+ , which was characterised by hplc and MS.

4-(2-Methylamino-thiazol-4-yl)-benzoic acid (Example 8.51)

To 25 ml of ethanol were added 4-(2-bromoacetyl)benzoic acid (486 mg, 2 mmole) and N-methyl thiourea (180 mg, 2 mmole). The reaction mixture was refluxed for 3 hr and the TLC showed the disappearing of the starting materials and the formation of a fluorescent product. The reaction was cooled on ice. The product was collected on

filtration and washed with ethanol pre-cooled to 0 °C twice (2 x 3ml), followed by diethyl ether. After drying, 486 mg product was obtained. ¹H NMR (DMSO-d₆, 400 MHz) δ 7.97 (2H, d), 7.89 (2H, d), 7.32 (1H, s), 2.96 (3H, s).

5 4-[2-(4,4-Difluoro-piperidin-1-yl)-thiazol-4-yl]-benzoic acid (Example 8.52)

4,4-difluoropiperidine (hydrochloride salt, 1.57 g, 10 mmole) and diisopropylethylamine (1.74 ml, 10 mmole) in acetone (10 ml) was slowly dropped into a mixture of ethoxycarbonylthiocyanate (1.02 ml, 10 mmole) in acetone (10 ml) at 0 °C. When the addition was completed, the reaction was kept under stirring at room temperature
10 for one hour. 3N hydrochloric acid (15 ml) was added and the reaction mixture was extracted with ethyl acetate. The organic phase was concentrated *in vacuo*.

To the residue was added concentrated hydrochloric acid (20 ml) and the reaction was kept at 80 °C for 5 hours. Water (30 ml) was added to the reaction. After the
15 neutralization with ammonium carbonate, the reaction mixture was extracted with ethyl acetate. The organic phase was washed with water and dried *in vacuo* to obtain the crude intermediate 4,4-Difluoro-piperidine-1-carbothioic acid amide (1.21 g). To the residue from above (360 mg , 2 mmole) and 4-(2-bromoacetyl)benzoic acid (486 mg, 2mmole) in THF (20 ml) were refluxed for 5 hours. TLC showed the disappearing of
20 the starting materials and the formation of a fluorescent product. The reaction was cooled on ice. The solid was collected by filtration. The product was recrystallized from ethanol (380mg). ¹H NMR (DMSO-d₆, 400 MHz) δ 7.96 (4H, m), 7.51 (1H, s), 3.66 (4H, m) 2.12 (4H, m).

25 Yields of the following title compounds in examples 8.53-8.61 and 8.63 were in general between 30 and 90%.

4-(2-Isopropylamino-thiazol-4-yl)-benzoic acid (Example 8.53)

Isopropyl-thiourea (2.47 mmol) and 4-(2-Bromo-acetyl)-benzoic acid (2.47 mmol) were
30 mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture was heated to 80 °C for 2 hours. The volume was reduced to 5 mL and the mixture was then cooled to -20 °C and filtered. The solid was washed with a small amount of diethylether

and dried. $m/z = 263.1$ in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

3-[2-(4-Methyl-piperazin-1-yl)-thiazol-4-yl]-benzoic acid (Example 8.54)

- 5 4-Methyl-piperazine-1-carbothioic acid amide (2.47 mmol) and 3-(2-Bromo-acetyl)-benzoic acid (2.47 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture was heated to 80 °C for 2 hours. The mixture was then cooled to room temperature and filtered. The solid was washed with a small amount of diethylether and dried. $m/z = 304.1$ in MS ES+, which was characterized by hplc and
10 MS and used in the next step without any further purification.

3-(2-Isopropylamino-thiazol-4-yl)-benzoic acid (Example 8.55)

- Isopropyl-thiourea (2.47 mmol) and 3-(2-Bromo-acetyl)-benzoic acid (2.47 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture was
15 heated to 80 °C for 2 hours. The volume was reduced to 5 mL and the mixture was then cooled to -20 °C and filtered. The solid was washed with a small amount of diethylether and dried. $m/z = 263.1$ in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

20 4-(2-Piperidin-4-yl-thiazol-4-yl)-benzoic acid (Example 8.56)

- 4-Thiocarbamoyl-piperidine-1-carboxylic acid tert-butyl ester (2.47 mmol) and 4-(2-Bromo-acetyl)-benzoic acid (2.47 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture was heated to 80 °C for 2 hours. The volume was reduced to 5 mL and diethylether (5 mL) was added. The mixture was then
25 cooled to -20 °C and filtered. The solid was washed with a small amount of diethylether and dried. $m/z = 289.1$ in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

4-[2-(1-Methyl-piperidin-4-yl)-thiazol-4-yl]-benzoic acid (Example 8.57)

- 30 To a solution of 4-(2-Piperidin-4-yl-thiazol-4-yl)-benzoic acid (1 mmol) in acetic acid (0.5 mL), methanol (3 mL) and tetrahydrofurane (4.5 mL) was added formaldehyde (aq. 37%, 300 mL) and polystyrene bound cyanoborohydride (2.36 mmol/g, 900 mg). The slurry was then agitated for 16 hours at room temperature. The slurry was then filtered and the resin washed with methanol (2 mL). The solution was concentrated to dryness

in vacuo. $m/z = 303.1$ in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

4-[2-(Pyridin-3-ylamino)-thiazol-4-yl]-benzoic acid (Example 8.58)

- 5 Pyridin-3-yl-thiourea (2.06 mmol) and 4-(2-Bromo-acetyl)-benzoic acid (2.06 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture was heated to 80 °C for 2 hours. The mixture was then cooled to room temperature and filtered. The solid was washed with a small amount of diethylether and dried. $m/z = 298.0$ in MS ES+, which was characterized by hplc and MS and used in the next step
- 10 without any further purification.

4-[2-(Pyridin-2-ylamino)-thiazol-4-yl]-benzoic acid (Example 8.59)

- Pyridin-2-yl-thiourea (2.06 mmol) and 4-(2-Bromo-acetyl)-benzoic acid (2.06 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture
- 15 was heated to 80 °C for 2 hours. The mixture was then cooled to room temperature and filtered. The solid was washed with a small amount of diethylether and dried. $m/z = 298.0$ in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

20 4-(2-Cyclopentylamino-thiazol-4-yl)-benzoic acid (Example 8.60)

- Isothiocyanato-cyclopentane (4 g) in ammonia (37% in water, 8 mL) and methanol (32 mL) was stirred for 16 hours, filtered of and dried. The Cyclopentyl-thiourea (2.06 mmol) and 4-(2-Bromo-acetyl)-benzoic acid (2.06 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture was heated to 80 °C for 2 hours.
- 25 The mixture was then cooled to room temperature and filtered. The solid was washed with a small amount of diethylether and dried. $m/z = 289.05$ in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

4-(2-Cyclopropylamino-thiazol-4-yl)-benzoic acid (Example 8.61)

- 30 Isothiocyanato-cyclopropane (4 g) was mixed with ammonia (37% in water, 8 mL) and methanol (32 mL) at 0 °C and then stirred for 16 hours at room temperature. The mixture was then cooled to 0 °C, filtered, washed with a little water and dried. The Cyclopropyl-thiourea (2.06 mmol) and 4-(2-Bromo-acetyl)-benzoic acid (2.06 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture

was heated to 80 °C for 2 hours. The mixture was then cooled to room temperature and filtered. The solid was washed with a small amount of diethylether and dried. m/z = 261.0 in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

5

4-[2-(Cyclopropyl-methyl-amino)-thiazol-4-yl]-benzoic acid (Example 8.62)

4-(2-Cyclopropylamino-thiazol-4-yl)-benzoic acid (1.98 mmol), methyl iodide (4.36 mmol) and potassium carbonate were mixed in DMF (20 mL) and stirred for 72 hours at room temperature. The mixture was concentrated to dryness and partitioned between
10 dichloromethane and water. The organic layer was dried (MgSO₄) and concentrated to dryness. This solid was mixed with THF (4 mL), methanol (2 mL) and 1N LiOH (3 mmol) and heated to 50 °C for 1 hour. The mixture was then cooled to room temperature and 1N HCl was added until pH 4. The mixture was concentrated *in vacuo*, then the
15 obtained residue was redissolved in dichloromethane-methanol and concentrated onto silica. Flash chromatography of the residue (silica gel, dichloromethane-methanol) gave the title compound as an off-white solid (0.1g), m/z = 275.0 in MS ES+, which was characterised by hplc and MS.

4-[2-(1-Methyl-pyrrolidin-3-yl)-thiazol-5-yl]-benzoic acid (Example 8.63)

20 3-Thiocarbamoyl-pyrrolidine-1-carboxylic acid tert-butyl ester (2.47 mmol) 4-(2-Bromo-acetyl)-benzoic acid (2.47 mmol) were mixed in THF (12 mL). After stirring at room temperature for 5 minutes the mixture was heated to 80 °C for 1 hour. The mixture was then cooled to room temperature and filtered. The solid was washed with a small amount of diethylether and dried. m/z = 304.1 in MS ES+. This solid was then mixed in
25 dichloromethane-trifluoroacetic acid (2:1) and kept at room temperature for 20 minutes. The mixture was concentrated to near dryness and the concentrated once from dichloromethane and once from 1 N HCl in diethylether. The remaining solid was mixed with acetic acid (0.5 mL), methanol (3 mL) and tetrahydrofurane (4.5 mL) and formaldehyde (aq. 37%, 300 mL) and polystyrene bound cyanoborohydride (2.36
30 mmol/g, 900 mg) was added. The slurry was then agitated for 16 hours at room temperature. The slurry was then filtered and the resin washed with methanol (2 mL). The solution was concentrated to dryness *in vacuo*. m/z = 289.0 in MS ES+, which was characterized by hplc and MS and used in the next step without any further purification.

2-(1-methylpiperazine-4-yl)-6-(4-carboxyphen-1-yl)-pyridine hydrochloride (Example 8.64)

2.6-dibromopyridine (11.8g, 50mmol) was dissolved in dimethylformamide (50ml) and 1-methylpiperazine (5.0g, 50mmol) and sodium iodide (0.6g) was added. The solution was heated to 80 °C for 30 minutes, then allowed to reach room temperature and diluted with ethyl acetate and water. The water layer was carefully extracted and the organic layers were collected, dried (Na₂SO₄) and concentrated. Flash chromatography of the residue on silica-gel (packed with ethyl acetate) using ethyl acetate-methanol-triethylamine 20:2:1 as the eluant. Pure fractions were collected and concentrated.

1.54g of the residue was dissolved in dimethoxymethane(48ml) and tetrakis(triphenylphosphine) palladium(0) (5.0g) was added. The solution was degassed and stirred for 15minutes under N₂. 4-ethoxycarbonylphenylboronic acid (1.16g) was added followed by 36ml aq. 1M sodium hydrogen carbonate solution. The solution was degassed one more time and heated to reflux and stirred for 12hours. The solution was filtered and the filtercake was carefully extracted with ethyl acetate and dimethoxymethane. The extracts were evaporated and purified by flashchromathography on silica-gel (packed with ethyl acetate) using ethyl acetate-methanol-triethylamine 20:2:1 as the eluant. Pure fractions were collected and concentrated. The residue was dissolved in 30ml concentrated hydrochloric acid and was refluxed for 12hours. The solution was evaporated to yield the title compound as a solid. ¹H-NMR (400MHz, DMSO-d₆) δ 2.7 (3H, m) 3.3 (4H, m) 4.5 (4H, m) 7.0 (1H, m) 7.4 (1H, m) 7.8 (1H, m) 8.0 (1H, m) 8.15 (1H, m) 11.5 (1H, bs).

4-(6-Morpholin-4-yl-pyridin-2-yl)-benzoic acid hydrochloride (Example 8.65)

2.6-dibromopyridine (2.0g) was dissolved in dimethoxymethane and morpholine (4.0ml) and sodium iodide (0.3g) was added. The solution was heated to reflux for 1hour, then allowed to reach room temperature. The obtained solution was diluted with ethyl acetate, washed with water, then dried (Na₂SO₄), filtered and concentrated. Flash chromatography of the residue using stepwise gradient elution (ethyl acetate in hexane 20-33%). Pure fractions were concentrated and then subjected to Suzuki coupling as described in example 8.64, then purified by flash chromatography as described above. Pure fractions where collected and concentrated, then the residue was dissolved in 30ml concentrated hydrochloric acid and was refluxed for 1 hour. The obtained solution was evaporated to yield the title compound as a solid. ¹H-NMR (400MHz, DMSO-d₆) δ

3.6 (4H, m) 3.7 (4H, m) 6.9 (1H, m) 7.3 (1H, m) 7.7 (1H, M) 7.9 (2H, m) 8.1 (2H, m).

Example 9

Fluid phase synthesis of N-[(1S)-1-((3aS,6S,6aS)-6-Fluoro-3-oxo-hexahydro-furo[3,2-b]pyrrole-4-carbonyl)-3-methyl-butyl]-4-[5-methyl-2-(4-methyl-piperazin-1-yl)-thiazol-4-yl]-benzamide

i) 4M HCl in dioxane ii) Cbz-Leu-OH, WSC, HOBt, DCM iii) Dess-Martin reagent, DCM
iv) 1,1,2-trimethoxyethane, p-TsOH, MeOH, 60 °C v) H₂/Pd(C) vi) RCOOH, WSC, HOBt, DCM vii) TFA

- 10 a) [(1S)-1-((3R,3aR,6S,6aS)-6-Fluoro-3-hydroxy-hexahydro-furo[3,2-b]pyrrole-4-carbonyl)-3-methyl-butyl]-carbamic acid benzyl ester (2')
- (3R,3aR,6S,6aS)-6-Fluoro-3-hydroxy-hexahydro-furo[3,2-b]pyrrole-4-carboxylic acid *tert*-butyl ester (1') (20.24 mmol) was dissolved in 4M HCl in 1,4-dioxane, and stirred at room temperature for 1 h. The solvent was then removed under vacuum, and the
- 15 residue was suspended in dichloromethane (50 ml), and treated with Cbz-Leu-OH (20.24 mmol), WSC·HCl (22.26 mmol), HOBt (22.26 mmol) and NMM (40.48 mmol). The reaction mixture was stirred at room temperature overnight, then washed with saturated aqueous NaHCO₃, dried and concentrated. The residue was purified by column chromatography (ethyl acetate-hexanes 1:1, R_f 0.23) to afford compound 2
- 20 (15.62 mmol, 77%). MS(ES) m/z 395 (100%, [M+H]⁺).

b) [(1*S*)-1-((3*aS*,6*S*,6*aS*)-6-Fluoro-3-oxo-hexahydro-furo[3,2-*b*]pyrrole-4-carbonyl)-3-methyl-butyl]-carbamic acid benzyl ester (3')

A solution of compound 2' (15.61 mmol) in dichloromethane (70 ml) was treated with Dess-Martin periodinone (15.61 mmol), and the reaction mixture was stirred at room temperature overnight. The solution was then washed with saturated aqueous NaHCO₃, dried and concentrated, and the residue was purified by column chromatography (ethyl acetate-hexanes 1:1, R_f 0.37) to afford compound 3 (9.38 mmol, 60%). MS(ES) m/z 393 (15%, [M+H]⁺), 411 (100%, [MH+H₂O]⁺).

c) [(1*S*)-1-((3*aS*,6*S*,6*aS*)-6-Fluoro-3,3-dimethoxy-hexahydro-furo[3,2-*b*]pyrrole-4-carbonyl)-3-methyl-butyl]-carbamic acid benzyl ester (4')

A solution of compound 3' (8.49 mmol) in anhydrous methanol (50 ml) was treated with 1,1,2-trimethylorthoformate (24 ml) and *p*-TsOH (catalytic amount), and stirred at 60 °C for 3 h. The reaction mixture was then cooled down to room temperature, the solvent was removed under vacuum and the residue was purified by column chromatography to afford compound 4' (7.42 mmol, 87%). MS(ES) m/z 439 (100%, [M+H]⁺).

d) N-[(1*S*)-1-((3*aS*,6*S*,6*aS*)-6-Fluoro-3,3-dimethoxy-hexahydro-furo[3,2-*b*]pyrrole-4-carbonyl)-3-methyl-butyl]-4-[5-methyl-2-(4-methyl-piperazin-1-yl)-thiazol-4-yl]-benzamide (5')

Compound 4' (0.625 mmol) was dissolved in ethanol (15 ml), and treated with a catalytic amount of Pd (10% wt Pd in carbon). The reaction was stirred under hydrogen atmosphere for 3-4 h. The reaction mixture was then filtered through a celite cake, and the cake was washed with ethanol, the organic extracts were combined and concentrated under vacuum. The residue was then dissolved in dichloromethane (15 ml) and treated with 4-[5-Methyl-2-(4-methyl-piperazin-1-yl)-thiazol-4-yl]-benzoic acid (0.60 mmol), WSC·HCl (0.625 mmol) and HOBt (0.625 mmol). The reaction mixture was monitored by HPLC. When the reaction had finished (4 h) the organic solution was washed with saturated aqueous NaHCO₃, dried and concentrated, and the residue was purified by preparative HPLC to afford compound 5 (0.30 mmol, 50%). MS(ES) m/z 604 (100% [M+H]⁺).

e) N-[(1*S*)-1-((3*aS*,6*S*,6*aS*)-6-Fluoro-3-oxo-hexahydro-furo[3,2-*b*]pyrrole-4-carbonyl)-3-methyl-butyl]-4-[5-methyl-2-(4-methyl-piperazin-1-yl)-thiazol-4-yl]-benzamide (6')

Compound 5' (0.21 mmol) was dissolved in neat trifluoroacetic acid (2 ml) and stirred at room temperature. The reaction was monitored closely by HPLC, to avoid cleavage of the tertiary amide. As soon as the starting material disappeared (3 h 45 min) the TFA was removed under a stream of nitrogen, and the residue was partitioned between ethyl acetate and saturated aqueous NaHCO₃, the organic extracts were dried and concentrated under vacuum, and the residue was dissolved in acetonitrile-water 1:1 (2 ml) and freeze-dried overnight to afford compound 6' as a white solid (0.20 mmol, 94%). MS(ES) *m/z* 558 (10%, [M+H]⁺), 576 (100%, [MH+H₂O]⁺).

Biological Examples

15 Determination of cathepsin K proteolytic catalytic activity

Convenient assays for cathepsin K are carried out using human recombinant enzyme, such as that described in PDB.

ID BC016058 standard; mRNA; HUM; 1699 BP.

20 DE Homo sapiens cathepsin K (pseudosclerosis), mRNA (cDNA clone MGC:23107
RX MEDLINE; . RX PUBMED; [12477932](#).

DR RZPD; [IRALp962G1234](#).

DR SWISS-PROT; [P43235](#);

25 The recombinant cathepsin K can be expressed in a variety of commercially available expression systems including E coli, Pichia and Baculovirus systems. The purified enzyme is activated by removal of the prosequence by conventional methods.

30 Standard assay conditions for the determination of kinetic constants used a fluorogenic peptide substrate, typically H-*D*-Ala-Leu-Lys-AMC, and were determined in either 100 mM Mes/Tris, pH 7.0 containing 1 mM EDTA and 10 mM 2-mercaptoethanol or 100 mM Na phosphate, 1 mM EDTA, 0.1% PEG4000 pH 6.5 or 100 mM Na acetate, pH 5.5 containing 5 mM EDTA and 20 mM cysteine, in each case optionally with 1M DTT as stabiliser. The enzyme concentration used was 5 nM. The stock substrate solution

was prepared at 10 mM in DMSO. Screens were carried out at a fixed substrate concentration of 60 μ M and detailed kinetic studies with doubling dilutions of substrate from 250 μ M. The total DMSO concentration in the assay was kept below 3%. All assays were conducted at ambient temperature. Product fluorescence (excitation at 390 nm, emission at 460 nm) was monitored with a Labsystems Fluoroskan Ascent fluorescent plate reader. Product progress curves were generated over 15 minutes following generation of AMC product.

Inhibition Studies

Potential inhibitors are screened using the above assay with variable concentrations of test compound. Reactions were initiated by addition of enzyme to buffered solutions of substrate and inhibitor. K_i values were calculated according to equation 1

$$v_0 = \frac{VS}{K_M \left(1 + \frac{I}{K_i} \right) + S} \quad (1)$$

where v_0 is the velocity of the reaction, V is the maximal velocity, S is the concentration of substrate with Michaelis constant of K_M , and I is the concentration of inhibitor.

Compounds of the invention bearing the distinctive halogen substituent in the P1 group were assayed against the closest individualised compound of the abovementioned WO 02057270:

| Compound | Cathepsin K K_i nM |
|---|-------------------------|
|  <p>Prior art: Example 10 of WO 02057270</p> | 66* |

It will be apparent that introduction of at least one halogen atom to P1, according to the invention has surprisingly resulted in a 10 fold increase in potency.

* Note that the K_i indicated in WO 02057270 for the prior art compound is the less
 5 potent 0.1 micromolar, whereas the above trials reflect accurate side by side trials in the same assay system.
